Picked up an S38B to relive my childhood and it seems to work on AM
about as well as my only other receiver, TS430.

I am going to make it my AM station receiver if and when I can get the
BFO to work. I still need the Kenwood to know where the Ranger is at.

I tried moving the E wire around as suggested in the manual but it did
not help. No heterodyne at all.

Anyone with any experience with this?

Jack,
Try the S 38 website. He has lots of info.

I found that site about 5 mins after posting the question. The first time I went there I got side tracked in a bra site... like size 38 b?

It was very strange.. S38 guy but whenever I clicked on the link to s38b I got this stupid bra site.

Anyway, I tried his fix and it worked like a charm, only too well. I now have a BFO but the sig strength suffers dramatically even in the am mode.

Wish I understood what was going on. Before I "fixed" it, the sigs got louder when I switched to CW.

Just for fun, try a kludge BFO. Place an AM broadcast band radio (non-digital) as physically close to the S38 as you can get it. Tune the broadcast band radio until you hear a beat with the AM or CW signal you are listening to on the S38. The oscillator in the AM radio should leak into the S38 to cause the beat. Course it depends on somewhat poor shielding on both receivers to work. I sometimes used this method as a kid to listen to SSB and CW on those old SW receivers that didn't have a BFO. Those were the days... ;)

Unless I'm confusing it with a different version that did have a real
BFO (which does't seem the case given your comments), the "BFO" on
that radio is actually the IF amplifier going into oscillation. The
wire you mention is positive feedback, so the stage will oscillate
and thus beat with the incoming signal.

It's a cheap way of getting a beat signal, since it doesn't require
a separate tube. On the other hand, it doesn't give you much control.

The stage is being used like a regenerative receiver, ie positive
feedback. A real regen detector has something to control the
level of feedback. So it goes from merely being an amplifier to
where there is regeneration (the same stage amplifies the signal,
and the feedback means it amplifies it again and again), so the
gain goes up, and selectivity should also improve. But, when
the stage kicks into oscillation, that isn't necessarily the best
place for amplification (I've heard conflicting views about this,
and some have said it's merely that one isn't controlling the stage
properly and good gain and selectivity can be had while the stage
is oscillating).

What it sounds like is you had the feedback wire set so the stage
did have some positive feedback, but not enough for the stage
to go into oscillation, so you noticed the increased gain.

I don't know if there is a control to adjust the regeneration, but if there is, that might help. Turning it down from where it oscillates would simply give you gain and better selectivity.

When using the IF stage as the beat oscillator, you really don't get much control since the same stage is doing two different things. On the other hand, at the time of the receiver's design, a BFO was really mostly so you'd hear some tone when tuning a CW station, and it was sufficient. It was only as SSB became more popular that such schemes might not provide enough of a beat signal for proper demodulation.

Whether legend, myth, or fact, here is the best guess of the origin of BA

THREE VERSIONS -- Opinions From The Internet.

Version I -- During World War II, Military Radio Techs used the term BoatAnchor as they struggled with the huge, heavy, electronic equipments of the day -- full of transformers, tubes etc. Also the US Navy frequently marked electronic gear with an anchor. After the war -- tons of the equipment appeared on the surplus market and was dubbed BoatAnchors due to the reasons above - one or both.

Version II -- After WWII a national magazine editor answered a query "As what to do with an outdated heavy, large, surplus electronic instrument?" and answered "Tie a line to it and use it as a BoatAnchor"

Version III A letter to the editor appeared on page 16 of the October 1956 issue of CQ and was as follows: Gentlemen: I recently acquired a "Signal Corps Wireless Set. No. 19 MK II Transceiver." Are there schematics or conversion data for this rig? Any info will be appreciated.

The editor replied: The only conversion we seem to have on the files here at CQ calls for 100 feet of 1" Manila line, one end of which is to be tied securely around the MK II Transceiver.

This then converts the unit into a fine anchor for a small boat. If any readers have better conversions we will be glad to hear about them. Ed.

Happy New Year -- CL

The general fact is that a stage has maximum useable amplification and
selectivity just *before* the point of oscillation

I believe that Version I and II are correct. Only the timeline may be subject to query. There was quite a disdain for certain B/A's in the 40's and 50's and they were, indeed, referred to as B/A's. In 1946, QST said the BC-375 and 191 were useful for parts only and one would suffer a pink ticket from the FCC seconds after it was put on the air. I also have one surplus conversion manual that states of the BC-640 (a heavy-duty VHF transmitter): "This unit will generate TVI even when turned off...". That was then and now is now.... Yesterdays junk is today's treasured B/A. And... don't even THINK about adding an S-meter to that BC-342...! Hi!!

But 3 is an absolute. I've seen that issue of CQ, well I did read
the letter in CQ though I can't verify the issue, and there was such
a letter.

And 2 could actually be a variant on 3, since it is far vaguer (no
magazine mentioned, no specifics, no names).

In other words, the one about CQ can be verified, while the others
are fairly nebulous.

I really enjoy seeing pictures of the different radio equipment. Is
there a site that you guys
might know of that has picks and info about the differant radios.
People mention their equipment all the time in the different forums and
usually I don't know what they are talking about.I am a fairly new ham
and am trying to learn all I can.When someone says they have a
so and so type rig I would like to look it up and learn about it.
thanks

It is entirely appropriate, and I appreciate you telling us of our
loss. You and he must have been close for you to post the notice here.
I'm very sorry for your loss. God rest him merry.

Yet again, Ladies and Gentlemen, we are diminished. It's time to close
ranks and move on, keeping Mike in our minds.

Very 73, Mike Fallon.

21. Squegging in LC oscillators

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-01-02 15:55:29 UTC
From: Tim Shoppa <shoppa@trailing-edge.com>
Message-ID: <1167753329.259479.53680@k21g2000cwa.googlegroups.com>
Source record: 9565
Cross-posted to: rec.radio.amateur.homebrew,rec.radio.amateur.boatanchors,sci.electronics.design

I have been playing around with my homebrew VFO, a Hartley oscillator, with a tapped inductor in the tank.

Rough parameters: 6AH6 pentode for the VFO, tank resonant at 1.8Mc, plate circuit resonant at 3.6Mc. Rather low-Q plate tank (on purpose, I want it to cover 100kc or so). Tank tapped about 1/3 of the way from the bottom. 150V from an 0A2 on the screen, bypassed by a 0.005 uF ceramic with short leads at the screen.

While playing around with it I found this weird mode where it wouldn't necessarily start up in constant oscillation. It would repeatedly (30000 times a second) start up (starting up very quickly, in just a few cycles), grid and cathode circuit amplitude would build up to about 10V p-p, then the oscillations would slowly (over the next 30 microseconds) die down. Then it would repeat.

Hand capacitance near the grid or on the tank coil would often break it out of this mode and into more regular oscillation. Putting a 10x scope probe on the grid sometimes broke it out of this mode too.

What eventually made the circuit more reliable was putting a few hundred ohms in series with the grid. But I don't understand exactly how this helped.

My guess for this squegging mode is that the oscillator would suddenly start, the tank would ring, the tank would ring hard enough that grid current flowed, and that the grid current somehow would "latch" on until oscillation died out, then it would repeat.

Or, just maybe, it's more closely related to screen current and maybe some kind of oscillation of the 0A2 in the screen regulator. I tried changing the dropping resistor feeding the 0A2 and a couple different 0A2's but the squegging seemed relatively insensitive to it.

Trying some other pentodes that were not so "hot" (e.g. 6AU6, 6BA6) changed the squegging a little but it was still there.

My not-understood fix, putting a few hundred ohms in series with the grid, is something that I've often seen in real-world circuits. I think this is to provide some degeneration, and always was under the impression that the degeneration was intended to prevent oscillation in the VHF range. It is possible that the circuit was indeed oscillating at a few hundred Mc but my scope (100Mc bandwidth) didn't see it. And I don't know how a 200Mc parasitic might cause 30kc squegging.

Any thoughts?

Tim KA0BTD

(snip)

(my guess)
The grid acts as a rectifier that builds a DC grid bias
voltage from the rectified AC signal, biasing the tube off.
Then the tank dies a natural death. Adding the series
resistor reduced the efficiency of the rectification.

Sounds like you have too much positive feedback, to begin with.

But in a "normal-functioning" oscillator, the DC grid bias doesn't cut things off for so long, right?

The P-P amplitude at the grid (as seen by my 10x scope probe) when the circuit is not squegging is in fact larger than when it is squegging.

I suppose it is possible there's some weird kink in tube characteristics for all the pentodes I tried.

> Adding the series

Probably, but moving the tap on the tank coil had little effect. The handbook says about a third of the way up from the ground end, but I tried it at a half, two-thirds, one-tenth, etc. It did alter the shape and timing of the squegging a little bit but it was still squegging. If I moved it too far the circuit didn't oscillate at all (too little feedback).

Also, changing the biasing (trying to move it further into class A) by putting a cathode resistor in didn't help much either.

Tim.

Right. If you don't have way too much loop gain, the bias
just shifts enough from the grid leak effect to slightly
lower the loop gain so that a stable oscillation takes
place. The negative feedback loop that adjusts this gain
adjustment effect can be stable or unstable.

My concept may be over simplified, and not include
everything that is happening. I would look at the screen
bias voltage during the squeeging to see if it is also
bouncing with it, or remains stable through a cycle.

Spice is your friend. I have found that LT spice is particularly good
at predicting squegging, at least in general. There's never a 1:1
correspondence with the real thing, but close is pretty good in RF.

When I have experienced squegging like this it has been because I have
built a circuit with a resonance between the circuit capacitances and
the RF chokes (you know -- those things you use for biasing that you
treat as 'shorts' in your AC analysis?). To the bias circuit, the
oscillator looks like a negative resistance, so you get two modes of
oscillation at once.

This is complicated by the fact that the circuit wouldn't oscillate at
the lower frequency at all if it weren't for the action of the intended
oscillation -- it's the current requirements of the active device as
oscillation build up that cause the negative resistance action that
causes squegging.

I suspect that your grid resistor is killing the Q of the circuit at
30kHz, which kills the squegging without killing the intended mode of
oscillation. You may find that loading any bias chokes with carefully
selected, unbypassed series resistance will also kill the squegging.
You can also sometimes kill it by reducing selected bypass capacitances
to lower the circuit Q at the squegging frequency.

Of course all of this also lowers the circuit Q at the desired
oscillation frequency -- that's life. Your job is to find a happy
medium that gives you good oscillator performance without squegging. Or
start building superregenerative receivers!

Wow, man, if I make it happen again I see the screen voltage motorboating up and down by about 3V (around the nominal 150V) at about 30kc.

Changing the screen bypass capacitor between 680pf/0.001/0.002/0.005/0.010 and changing the current through the 0A2 between 5mA and 10mA and 20mA and 30mA doesn't stop the squegging but it does somewhat alter the timing/amplitude.

Plate can be held at a steadyish 350V (even bypassed) through all this.

So this is something like the textbook squegging which seems to be something like a motorboating of the plate voltage, but in my case I see it in the nominally regulated screen instead. New one for me!

I don't think this is quite like the typical NE-2 relaxation oscillator circuit, because I thought 0A2's were supposed to be stable with these small amounts of capacitance and the behavior seems independent of room lighting, but I could be wrong. The screen voltage waveform sure as hell looks like a relaxation oscillator at 30kc.

Looking at my old schematics I see my Heath HW-16 crystal oscillator puts the crystal between the screen and the grid of a 6CL6. Manual says that the screen is serving as the plate of the oscillator. Probably completely unrelated to the intended operation of my oscillator (where I bypass the screen and the leads are short) but may be related to the unintended mode of operation!

Tim.

I think you are talking yourself out of the problem.

It sounds like you are trying to build an electron-coupled Hartley
oscillator. There is no way that a voltage change of 3 volts on the screen
(which is functioning as the anode, for Hartley purposes) is going to start

and stop the oscillator.

Watch the DC voltage on the grid. You will see it follow the relaxation oscillator waveform when the thing is squegging.

The fundamental problem is two-fold. First, too much feedback. Second, the time constant of the grid circuit is too long. The stored energy in the tank can continue to charge the coupling cap even after the plate current is cut off, and it can't start to oscillate again until the charge on the coupling cap bleeds off.

Start by lowering the grid circuit resistance and lowering the capacitance of the grid coupling capacitor. This will work to cure both evils. Taking a quick look at the 6AH6 curves I would guess that, at 6 MHz, your coupling cap should be about 22pF and the grid return about 10K. The 6AH6 is also a sharp-cutoff pentode, so it will be very sensitive to small grid voltage changes near cut-off.

Don't get distracted by the swings in screen volts, you are just drawing large pulses of current and pulling the supply down. Unless the 0A2 is going out of conduction RC oscillation is unlikely.

What you write, which relates the Q (probably very low hundreds) of the tuned circuit and it's frequency to the period the squegging, is in good agreement with the squegging I observe. Will check the DC grid voltage with the scope tonight.

The grid tuned circuit is at 1.8Mc, and the squegging seemed insensitive to the coupling cap. 100pF is the handbook value, but I did play around with it. Too small (39pF) and no oscillation. At 56pF there was squegging.

Did not try playing with the grid return value (still at 47K from the handbook), that may indeed be the key.

Tim.

Actually, I already did that but it's a pretty academic exercise.

After all is said, seems like there should be some way to control the
feedback to both provide a beat and optimize the gain/selectivity.

I have no interest in CW or sideband with this radio but I do need some
way to set my ranger on the station I am listening to.

Any thoughts on an outboard tweak?

The circuit is the "tuned plate Hartley" as it appeared in any
50's/60's/70's ARRL handbook.

The grid tuned circuit is at 1.8Mc, the bottom end of the inductor is
grounded, there's a tap nominally one third of the way up to the
cathode, and the top of the inductor is connected via a 100pF capacitor
to the grid, which has a 47K to ground.

The plate circuit in my current incarnation is tuned to the harmonic at
3.6Mc. The "untuned plate" version in the handbook has a RF choke
instead of a plate tuned circuit, and indeed I had this on the bench
for a little while.

Tim.

There's no control for it? That seems odd.

The trick is to make the cathode resistor variable, and use that to
control the level of regeneration.

> I have no interest in CW or sideband with this radio but I do need some

Don't put it on transmit, but key the oscillator? Old rigs often
were set up that way, so you'd have a weak signal from the transmitter
to set the receiver to.

Or, they'd have some spotting function specifically for it.

SC has been bragging for quite some time now about No-Coders - but has "yet" to show where "he" has ever been licensed as a ham at all let alone "with" code. I don't care to give my call here - but have in the past and will again if asked. It doesn't prove a thing one way or another. My call - though I'm an extra - happens to be my old KA Novice Call sign. Been an extra quite a while. Went from Novice - Technician (80s) - Advanced - Extra.

It is amazing you guys keep him in entertainment by acknowledging his ridiculous remarks. GET A LIFE - SC -whether we like it or not - CODE IS GONE. You're beating a horse that has been dead quite a while. You've been on this stupid kick for about 5 months now. Don't you have anything better to do?

43. Wanted Parts for 2-meter amp

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-01-03 03:51:34 UTC
From: Roger <GetValidAddress@my.com>
Message-ID: <hn9mp2t1mlmd1jr2vinikdn2dsd6b2ie8a@4ax.com>
Source record: 9586

I'm looking for parts to build a 2-meter amp. I currently have a portion of the power amp from an old GE repeater that uses 4-125s. I'd like to find a couple more of these or something a bit more modern. I'm probably going to replace the 4-125s with external anode tubes. I'd like to end up with close to a KW SSB and CW out if possible but will take what ever I can come up with.

Due to the low value and high weight of the parts I'm going to probably stick to the Lower Michigan area as shipping would be prohibitive.

The simplest way I can think of is to go over to the shelf of test equipment and grab the old Heath signal generator and attach a foot long wire close to the S-38. Then tune the generator to 455 kc (whoops, that is kHz). You will have a nice beat note.

Like the others have said, convert the if stage into an oscillator - then reduce the feedback to get it to stop oscillating. That will then be sort of a Q multiplier while in the feedback but not enough to oscillate stage. You would need a control to put in and out of oscillation. A pot, a variable capacitor or a switch.

Or, just a hum a few bars into the Ranger mike and tune for best audio.

> Any thoughts?
>
> Tim KA0BTD
>

I normally don't post, but, since I have done my own amount of torturing of
the 6AH6, I think i know what the problem is.

The 6AH6 is slightly misnamed.
The 6AH6 isn't really a pentode.
It's just a really small beam power tetrode.
It has usable gain up to the UHF region.
And it suffers a lot of the same personality disorders of it's larger
brothers.

It's rated at 3.2 watts plate dissipation.
But I have ran it close up to about 12.5 watts for extended periods.
At that point, the tube starts to show obvious signs that it's close to the
breaking point.
The plate starts glow red, but it didn't kill it.
Probably hurt it a good amount, but it didn't kill it.

The more current it pulls, and the lower the input and output impedance,
the higher the tendency for it to break into oscillation.
It will oscillate up to the UHF region easily.
It's preferred method of oscillation is the grounded grid form.
The cathode is the input, and the anode is the output.

When you have low resistance feedback loop from the plate to the cathode
over six or so inches long, and start pulling a good bit of power, then it
can go at any time.

Look up parasitic oscillation in your handbook..
You will see the circuit that is causing it.
Large power tubes top out at 100Mc or so.
But this small one can go up to 400 to 900Mc if it's being driven hard
enough.

The loop is most likely from your plate, through the tuning cap of the
output tank.
The cap will look like a short circuit at UHF.
It will then go through the chassis.

And then through the cathode tank, which is shorted by the tank cap at UHF.

Ways to solve the problem.
Turn down the plate, and screen voltage.
It will drop beam current.
That will increase the resistance of the tube to the point it can't
parasitically oscillate.

Or you could put a 100 ohm or 1000 ohm resistor in the plate circuit.
In big amplifiers, where you can't tolerate a large resistance in the plate
lead,
they use parasitic chokes.
The appear as a short to DC, and the desired operating frequency.
But they appear as a high resistance to the VHF oscillating frequency.
It basically de-Qs the VHF oscillating circuit.

But you can tolerate a little bit of loss in the plate circuit of this unit.
So, just put a 100 ohm resistor in series with the plate.
If that don't work, then try a 1K resistor.
I am pretty sure that it will settle down and behave.
It will be a lot easier that winding a parasitic choke for it.

You also want to take a careful look at the screen circuit.
It can also act like an output in a parasitic oscillation.
So, try putting a 100, or 1K resistor in series with it too.

It's oscillating cycle.
It starts it's HF oscillation gain cycle.
The signal grows, and the tube bias increases.
The current on the positive peaks grown with it.
The current on the positive peaks get to the point that
the tube breaks into UHF oscillation.
The UHF oscillations are several times larger than the intended oscillation.
The UHF oscillation only last a fraction of the high frequency cycle.
When it starts it's UHF oscillation, it quickly charges the grid capacitor
up to a very high level.
Way past cutoff.
The UHF oscillation quickly extinguishes it's self.
But since the tube is in cutoff, the intended HF oscillation dies too.
The grid voltage drops back to normal, and the tube starts the cycle again.

Other ideas
You could also increase the grid leak resistance.
Push it up to 1M or so.
It will decrease the tank loading, and allow it to start easier.
And it won't pull so much positive peak grid current,
and cause the tube to conduct so heavily on the positive peaks.

You can tease out the UHF oscillation into the open if you short the primary
grid tank,
so it can't oscillate at it's intended frequency.
Basically, zero signal condition.

Then, push up the plate, and screen voltage.
If you have a little signal strength meter that works up to the UHF range,
with it's antenna clipped to the chassis, or wiring.
You will se it start to come alive.
You will be able to move your hand around the unit,
and it will break into, and out of oscillation.
Sometimes, it will motorboat, or operate continuously.

You want to change the circuit so that you can't get it go parasitic,
even when you really push it to it's limits..

Then un-short the tank and you are ready to go.

49. WTD: National R175 Plate Choke

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-01-03 08:03:18 UTC
From: Dave Goncalves <davegoncalves@gmail.com>

Tim,

My guess is the OA2 (Neon) and Cap combination is causing the problem.
Isn't that an oscillator in itself ?

Try replacing the OA2 with a Zener (or 3 in series). It may be a bit
noisy, but it may also be stable.

Or... a pair of resistors to derive 150V from HT. Just to see if squeg.
stability improves/changes. 15k + 18k for a 350V HT (just a guess).

I have seen a number of them on eBay. I am sure there were more transformers than radios. I acquired 2 in a short while with no serious problem. It is a good transformer because it is sealed in oil - which means it is immune to the moisture that many transformers seem to absorb when stored in basements or barns.

> Give me a resistance value and an inductance value and I'll tell you
> what the current Miller part number is.

Scott,

This is a pretty special job, a custom stepped coil form with seperate
litz windings on each.
I don't think Miller has what I'm looking for. If it came to replacing
the current choke with another model, I've already got several in the
junkbox. What I'm looking for is an exact match to fit in the old
location. The amplifier I'm working with has a very nice period layout
I'm trying to preserve.

But, what the hay, see below:

The characteristics of the R-175 choke are:

Voltage breakdown to metal base 12,500 volts.
D.C. Resistance 6 ohms.
D.C. Current Rating 800 ma.
Inductance 225 microhenries
Distributed Capacity 0.6 micromicrofarad.

Thanks for the help,

Dave Goncalves

OK, I saw the parasitic last night!

I only have a 100MHz scope. Putting a scope probe on the circuit seems to often kill the squegging. But I put a little loop on the end of the scope probe and sniffed around, and indeed there was a 400MHz parasitic that would build up over maybe 0.1usec. Then the impulse from this set the tank ringing at 1.8MHz, and after the ringing mostly decayed (30usec or so) the cycle would repeat.

There seemed to be the most energy at the well-bypassed screen and not at the plate, but remember this is an electron-coupled oscillator so the screen is working as a plate.

I guess even a 0.001uF ceramic cap with short leads isn't a good bypass for 400MHz!

There must've been substantial 400MHz energy to show up on my 100MHz scope :-).

My band-aid of a resistor in series with the grid seems to do the trick.

Tim.

Is there an Antique radio parts store in Victor NY? I am heading over
to the Rochester area and I seem to remember a store there.

regards,
NEO

Your resistor in series with the grid would have much more effect on a
UHF oscillation than on one at 30kHz, indeed.

Even a 1nF chip cap soldered directly between the screen lead and
cathode of the tube would have the internal tube lead inductances to
contend with, so you're probably never going to 'get there from here' by
that method.

I wonder if a loading resistor in the screen lead instead of the grid
would work?

Nice post. A while ago, I went into "hair-pulling mode"
the other way - *trying* to cause squegging in a one
transistor DC-DC booster. Finally got it with a bit
of fiddling. Maybe it belongs under Murphy's section
on oscillators:

When you don't want oscillation, it will oscillate
When you want oscillation, it won't
When you want to get rid of squegging, you can't
When you want squegging, it won't

Do all Parisitics (sic) come from Paris? :-)

Yes.
My original reply also mentions that.

.....
You also want to take a careful look at the screen circuit.
It can also act like an output in a parasitic oscillation.
So, try putting a 100, or 1K resistor in series with it too.
.....

He says that the .001uf cap isn't much good at bypassing.
The problem is it's too good at bypassing.
It acts as a short to the UHF parasitic.
That allows enough UHF energy to be conducted to the chassis to allow it to go parasitic.
Shorting the energy to the chassis, isn't the cure to the problem, its the cause of the problem.

So I will clarify my previous statement.

You want a 100, or 1000 ohm resister in series with the screen.
Between the bypass cap, and the screen.
Not between the bypass cap, and the supply.

You want to isolate the capacitance from the screen.
That will break the loop required for oscillation.

I have a hard problem making a amplifier that can put out a solid 1.8Mhz
signal.
But I can build a DC power supply that produces a quality 80Mhz signal.

Maybe, if i want an oscillator, I should try to build a DC supply circuit,
and vice versa.
I will figure it out one of these days.

Okay, this is all easy to do, EXCEPT for that breakdown voltage rating.
A 2116-H will actually have substantially _less_ DC resistance, and
really only slightly lower Q. But the breakdown voltage is probably
higher. The litz wire design is basically to improve the filter Q,
but these days with modern ferrites you can make coils of the same value
with fewer turns, which reduces the necessity.

Since a 220 pf capacitor with ¼" leads self-resonates somewhere around 150 MHz., you might want to do the old "put a variable capacitor between screen and cathode and tune for minimum squeeg" trick. All you are doing is making a series resonant circuit with the stray inductance of the tube and the variable capacitor to short whatever nasties you don't want out.

Good thing I acquired mine when they were available. I know I saw one for sale not long ago for $20, which is a good buy.

they have a separate winding for the screen of the 813. This makes it easier to get 100% modulation, without having to match the screen dropping and shunt resistor resistor.

Indeed this is a working fix, as I verified on the bench.

> It's oscillating cycle.
> It starts it's HF oscillation gain cycle.

Actually in my particular case it appears that the UHF parasitic starts
first. But probably just the luck of the bias point.

> The signal grows, and the tube bias increases.
> The current on the positive peaks grown with it.

> the tube breaks into UHF oscillation.
> The UHF oscillations are several times larger than the intended oscillation.

Very true here - this is in fact the only time I've seen 400MHz stuff
on my 100MHz scope, so I'm guessing that there is substantial UHF
energy there.

> The UHF oscillation only last a fraction of the high frequency cycle.

This part is very true too. Tiny tiny fraction of a microsecond. My
interpretation of the scope trace is that the UHF activity gives the
the HF tank a "kick" and it rings for a while.

Tim.

I think it's a good idea to re-introduce AM at the low end of the band: there has been a lot more AM activity since the expansion, and I think a lot of hams are airing out their boatanchors now that there's more room to be used.

This is also a good opportunity to talk about a new band plan, with input from all concerned, and (hopefully) agreement on where AM'ers can operate in peace.

A guy in Tenn named Don (forgot his call) has been camping out there and
is doing a fine job of staking a claim.

I have a hard time tuning up down there and don't know why.

My ant is cut for 3885 but I would think the pi net on the SB200 would
take that in stride. Is this a bad assumption?

Jack,
The 1960 ARRL handbook has a single 813 amp and a GG amplifier with a pair
of
811s. The 17th edition (circa 1967) of Bill Orr's Radio Handbook features
designs for 813s and a specific design for a class-B modulator using a pair
of 811s.

After the 1960s, people turned to Linear amplifiers and switched to SSB from
AM.

I have for sale a B&K Dyna Quik Model 500 Tube Tester, SN 11383. It has a tube chart in the inside of the top cover, but no manual. It appears to be is working sometimes. I tested some tubes and some gave me a reading, but on others, I got no readings. I think some of the tube sockets may need cleaning. It also needs the ac pilot lite replaced. Cabinet is in fair condition. Price is $40 plus shipping from 79602.
Thanks, Charlie Hugg, K5MBX

Been looking at that but not sure how to accommodate 811's for mods.

Also, I do not understand the purpose of the Heising choke in it.

Anyone know?

The Heising choke removes the dc from the output side of the modulation transformer. The DC saturates the core and reduces fidelity.

This circuit is not common in ham gear because of the additional expense, weight and cost - but it was common in broadcast circles.

I would make one change to the 813/811 circuit. If you load the grid down with fixed resistors, you can remove the need for neutralization. You would load the grid side of the circuit enough so that full power from the exciter (a Ranger I recall)) would just drive the amplifier.

More sensitive tubes can get away with using a 50 ohm resistor and no tuning on the input. That would probably not result in sufficient drive (I have not worked with the numbers). However, you could use something like a 300 ohm resistor to load the grid then use a 4:1 step up broadband transformer. One less control. One less potential for overdriving the amp. No neutralization.

And, they work great as a replacement transformer for the Viking/ B&W, DX-100 series. Just the right size and winding ratio is close enough.

I used one years ago in my Viking 1 that had been the backup transmitter at a local broadcast station. They had removed the original transformer and used a 200 pound boatanchor at the bottom of the rack mount. I got mine sans transformer and the ART-13 transformer fit perfectly.

I miss that old rig.

Check for dynatron oscillations; the screen acts as a plate, sort of.
http://en.wikipedia.org/wiki/Dynatron_oscillator

I can't find a schematic of one, but it's just an oscillator with feedback
from the screen to the grid.

How long are the leads of your screen bypass cap, and where are they
soldered down?

Thanks,
Rich

I have for sale a Heathkit HW-101 Transceiver. It is in very nice shape cosmetically and it works on
LSB, but when I put is in the upper sideband position, it does not receive. It comes with the original manual and a Mobile Mic. No Power Supply. I can send digital picture upon request. Price is $95 plus shipping from 79602. Thanks, Charlie Hugg, K5MBX

I have a very nice Kenwood SM-220 Monitor Scope with the BS-8 Pan Adaptor Option installed.
The scope works very well and is in great condition cosmatically. It has few small scratches and marks around the outer trim of the front panel, but the front panel and cabinet are near perfect. It is from an estate and has been stored for almost 10 years. I checked it out for the past month and it functions as it should. Price is $375 shipped in CONUS. I can send digital pictures upon request. Thanks, Charlie Hugg, K5MBX

My thoughts exactly but what is a 4:1 broadband transformer, other than
the obvious?

I was talking to someone today about not tuning the input and he said it
can't be done.

Looking for the best all-tube general-coverage (0.5-30) receiver I can get.

Need good operation on SSB and CW and capability on AM, along with sensitivity, stability, ruggedness, and availability of replacement parts e.g. tubes (that last one might be difficult...).

I'm thinking Collins 51Jx or R-390, although I remember that I really liked an old Hammarlund I had once...

Would like to stay under $1000 but if I had to I suppose I could go as high as $2000 for something that's really mint.

What do you guys recommend I look for?

One can certainly use a 50 ohm load for the exciter and a broadband transformer with an impedance ratio sufficiently high so as to get the required RF voltage on the 813 grid, but:

- if the required turn ratio is high, chances are that neutralization will anyway be required, because the plate-to-grid RF voltage feedback (due to plate-to-grid capacitance) will not see the grid as a sufficiently low impedance point any more.

- it may not be easy to realize a broadband transformer properly working on the whole 160meters - 10m- range and also showing a high reactance value at any frequency across that range. In particular on the lower frequencies (e.g. 40 to 160 meters) its reactance may not be high enough to show the exciter a purely-resistive 50-ohm load. A resonating parallel capacitor (different for each band) may then be needed if one does not like the SWR meter to show some reflected power.

My 2 cents:

Most of the best older tube receivers (R390, R390A, National HRO's,
Hammurlund Super Pro's) did not have built in product detectors for SSB
reception. You will have to add a product detector if you buy one of
those. Product detectors can be had for under $200.

The best of the group is the R390A.

I own the R390A, & the HRO-50, HRO-60 & the SP210 Super Pro.
All are excellent receivers. The HRO's use plug in coils which makes
changing bands a P.I.T.A. The HRO's & the Super Pro have great audio,
but the R390A is a much better all around receiver. It (R390A) is a
pain to work on however.

Another good receiver is the National NC183D, but again, no product
detector for SSB.

For a tube radio that does it all out of the box, I'd vote for the
Drake R4A or R4B with auxillary crystals for your SW frequencies of
interest, or an add-on FS-4 frequency synthesizer. They provide
excellent out of the box reception on AM, SSB & CW. They are stable,
have 4 stages of selectivity & provide passband tuning.

As far as tubes are concerned, not to worry. There are literally
millions of tubes available either NOS (new old stock) or used from
many many suppliers.

I don't think you have to spend $2,000 for a very good radio. A top
condition R390A, with an add-on product detector should cost you $1,000
or less.

A minty R4A or R4B all crystalled up will go for around $300-$400. An
FS-4 frequency synthesizer for the Drake will be in the $400 range.

Steve,
You're asking the Ford vs. Chevy question...and everyone will have their favorite. There may not be one answer, at all. Given the top price you're willing to pay, you can have, arguably, any receiver you want that might be available. Your broad spec could be met by a myriad of receivers. Entering the Ford vs. Chevy argument, I'd recommend the Collins 51J4 or the R-390A. Cheaper but entirely usable would be the Hammarlund HQ-180AC. There are many, more esoteric, radios that can be had up to $2000, to be sure. You did mention, however, the implied ability to repair and maintain. Beware of equipment that is beyond a reasonable hope of home or local repair. For example, many excellent and modern receivers, especially military or high-end commercial, either require a depot repair environment or parts and modules that are virtually "unobtanium". What's not been said is what you really want to do with the gear. Is it simple short-wave listening or serious collecting? Maybe you could pass on more details about your requirements? And, which side of the pond are you on? de Jeep/K3HVG

Virtually all of the high end military vacuum tube boat anchors were
designed before SSB became common. They require an external converter
or the addition of a product detector and AGC mods to work properly.
The only receivers I can think of that meet your requirements are the
Hammarlund HQ-180 and the National NC-400. The 180 is quite common but
the 400 is very rare and pricey.

Regards, Roger

Boy, this is a question that could require a lot of beers among friends to fully explore.

Fred Osterman's Third Edition "Receivers Past and Present" (now out of print), is a good source of information to curl up in front of the warm winter fire and memorize.

The fact is that modern high end solid state receivers are better than the older tube models. They have product detectors, 1 Hz stability and readout and some even have dsp. However, you want a tube model. There is an implication that you want the tube model based upon nostalgia and/or aesthetics. Those values are subjective, so you will need to see how the radio makes you feel and what features bring joy to you.

I have some radios that use multi-position switches to tune in a station. They are excellent for tuning in stations at a known frequency, but terrible for "tuning around". Some look great in a rack, while others look great in their original cabinet. Tuning in sideband or cw is great with a product detector. I like to use full avc on cw, but others like the manual gain control. In short, it is all subjective. I recently purchased an old Lafayette KT-200 radio for $25 (that is the S-38 wanna-be with s-meter). Got it working and was shocked that, with the rf amplifier working full strength on the broadcast band, it is probably the best broadcast band receiver I have with a short antenna.

For short wave listening, I like the radios with push-pull audio, so if that is a big interest, look for radios with push-pull audio. The old SX-62 was not bad for audio, but not a good all around communications receiver.

The RA-17 is unique because it uses a Barlow-Wadley loop for stability. The 390A has a number of wonderful features and a lot of die hard supporters.

In the end, many collectors find that no radio is perfect. So, they collect as many as they can. Collectively, they have all the features they want. This requires a large room - preferably a heated museum. Better to be able to turn them all on at once, with a multi-antenna switch.

Now, where is the beer.

Colin K7FM

Collins R-390A is one of the best RF performers around. The audio quality
stinks and I would not consider it even slightly field-maintainable, but
if you want to pick weak signals up out of the muck you can't beat it even
with the latest Watkins-Johnson rig.

An outboard product detector will give you greatly improved SSB performance,
and will still make it under your price barrier if you can find one. If you
can find two, please call me because I want one too!

I'll agree that the R-390 or the A version are about the best.
For general coverage, consider an R-392. Doesn't have all
of the bells and whistles of the 390/A, but basically the same
rig, far cheaper. Of course, as others have pointed out, no product
detector.

Another possibility is a Halli SX-117, which does have true SSB.
Its primarily a ham band receiver, but with an external synthesizer
in place of the LO xtals, it works fine as a general coverage
rig. Restored one recently, and its performance is impressive.
It will haul in signals my TS-830 will not.

For the info of all, in case you haven't seen his ad, there's a Canadian guy that sells a very nice product detector kit on Epay. The price (about $175) is a lot less that the HC-10 or the several "CV-xxx" SSB converters. It has worked (on my gear) very well. It also will work with virtually any receiver with an I.F. of either 455 or 500 kHz. That could dispel worries of no SSB detection capability on a given receiver. Also, there's a company out West (S&S Engineering) that sells a multi-offset VFO that will convert any suitable receiver to general coverage. I did an article for the Drake R-4C (et al) using this unit. It beats the heck out of the Drake synthesizer abomination. FYI, the article was in ER, last year. Regards K3HVG

My correspondent in .UK who has an RA-17 _loves_ it. He has had various other fairly-good RXes, including at least one Collins 51J, but thinks his RA-17 beats them all hollow. Look up "Wadley loop"[1] for insight into why the RA-17 is pretty darned stable.

Or simply look at
<http://www.televideo.ws/wadley.html>,
<http://www.qsl.net/vk3jeg/b_wadley.html>, and
<http://www.qsl.net/n4xy/rcvr_racal.html>
for a start.

If I had house space for an RA-17, I'd be looking for one -- to go with the R-390, 2 R-390A, FRG-100, DEBEG 2000, RA-6217E, ITT/Mackay 3020, and the ricebox appliances.

[1] With the quotes this time.

My Racal RA-17 works fine on SSB, you just have to remember to adjust the
attenuator and/or IF gain to stop the detector overloading. Agc is
switchable for short/long time constant. There are external ssb and isb
adapters, the set has connectors for one, but I've not found one yet...

Yes, the Racal receivers are definitely nice, and good performers.
I have a RA2617D, which is a solid state version of the RA17. It
uses the same Wadley loop to create the 1 MHz hetrodynes that do
the conversions for the 1 MHz bands. It is an interesting way of
gaining stability from the hetrodyne conversions without requiring
the hetrodyne oscillator to be especially accurate, or stable.

The relatively inexpensive Yaesu FRG-7 also uses the Wadley loop. It's
an excellent performer for the price (although solid state).

I'll put a good word in for the RA-17 as well. Ergonomically I think it's
a little better than the R-390A, and it's a lot easier to work on, though
I don't think the RF performance as good.

On the other hand, it's a lot better than the newer solid-state Racal
receivers. I was really shocked to compare the R-17 with an R-1750
on a marine install... CW stuff that was easy to copy on the R-17 was
down in the noise floor on the newer receiver.

Somebody once wrote about them that Yaesu were so pleased at getting the
Barlow-Wadley loop working in solid-state that they forgot to give the
receiver any rf performance :-)

There's a whole raft of mods to bring it up to scratch though...

The Wadley loop is often seen in mystical terms, presumably because people aren't bothering to understand it. Obviously, it was a way in the fifties to get rid of that need for crystals every 500KHz, yet in retrospect I'm not sure that the effort couldn't have been put into a synthesizer. After all, generating a first mixer signal every 500KHz requires about the same circuitry if done with a PLL. A few years later there were receivers that used PLLs for such signals, though over the years I've seen posts where people mistake those PLLs with Wadley loops.

The problem with the Wadley loop is that it puts at least an extra mixer in the signal path, and by definition you can't put ultimate selectivity until three mixers down. Done right, as I'm sure it was done in the Racal receivers, it works. But done carelessly, and you have a receiver that uses a more esoteric design but automatically comes out worse than something done a different way. After the Racal, it mostly seems to have been used to cut costs, but once you reduce costs the extra mixers in the signal path are a liability.

Moving the "synthesizer" out of the signal path means you don't have that extra mixer in the signal path. And I'm not convinced that making a decent PLL that only has to generate signals every 500KHz is harder than all the filtering and isolation that the Wadley loop requires.

People have confused the PLL in the HRO-500 and the mix-sixties Galaxy receiver with the Wadley loop because on some level they are similar. I've explained the Wadley loop in the past so I'm not going to explain it again, but the HRO-500 PLL used a crystal oscillator at 500KHz, generated lots of harmonics, and then the variable oscillator would be locked to the harmonic of the reference. You'd be tuning the oscillator with a manual variable capacitor, with a small varicap to actually tune it to look by the voltage out of the phase detector. There is

similarity to the Wadley loop, but they aren't the same thing, and you get the "synthesizer" out of the signal path in the receiver. The circuitry would be about the same, if not a tad simpler, for the PLL.

SO in the end, I'm not convinced of the Wadley loop being anything more than a neat trick, which at first seemed like a great solution in the fifties but in retrospect may not have been.

Come the seventies with the FRG-7, there ultimately was no good reason to use the Wadley loop in there, and using a PLL might have given it better specs.

My RA-17 is racked up with a RA-1792, (synthesised solid-state, mine has
provision for remote control and modified eproms to allow tuning down to
0Hz!) the 1792 has better performance than the 17 but I still prefer
the older rx for general tuning around.

Try working one channel while an adjacent transmitter is operating a
few hundred KC away and you'll see why the RA-17 beats the RA-1792
for full-duplex radiotelephone service hands down.

The filters on the RA-1792 sure are nicer than on the RA-17, though,
and consequently audio quality on SSB is a whole lot better with less
noise.

Good evening, Jeep.

Technically, it's neither, but it's more the former than the latter.

I need something that can be used on certain military HF networks outside the amateur bands. I have been told that (for some goofball reason) I'm not allowed to say exactly which networks, but it isn't anything that would be particularly hard to guess if anyone cared to give it a few minutes of thought. :-)

The main reason I want old and all tubes and etc. is something I hesitate to mention, because every time I do, I get ridiculed as a Chicken Little and a paranoid (though, as we all know, it ain't paranoia if the sonsabitches really are out to get you!).

I firmly believe, in my heart of hearts, that sooner rather than later the United States (which, to answer your other question, is the side of the pond I'm on) will receive one or more nuclear attacks.

It could be a 10-kiloton device that gets smuggled into downtown Washington in the back of an SUV, or it could be a Jericho-style widespread attack, or anything in between.

When that happens, much of the solid state gear (radios, computers, cell phones, the Internet, packet BBSs, etc.) within a fairly large radius of ground zero will be reduced to doorstops and paperweights.

Assuming I'm still around after the attack, and since I'm within reasonable EMP distance of a few large cities, I would like to have set up at least a basic communications capability that has a chance of surviving that. A really good receiver is a first step that, as you all have noted, shouldn't cost too much.

Of course, that begs the question of how I'm going to power the damn thing if commercial power is down, but I guess I'll have to, as they say, jump off of that bridge when I come to it.

Anyway, I really do like the old gear, and though I'll almost certainly never be a serious collector, I wouldn't mind having, up and running, a few quality pieces from back in the day.

This is disappointing. I was expecting you to say something like that
you prefer radios that glow in the dark. But you're preparing for a
future in which everything glows in the dark for a while.

OK, you've got your tube rigs, and found a way to power them (maybe
a steam-powered generator fueled by the corpses?). Who do you plan to
listen / talk to, and why? Are they making preparations as well?

73's, but geez...

Obviously he'll be talking to those parts of the country that have not been hit & to others who are well prepared in his region. In such a post disaster scenario, communications will be vital & could potentially save many lives.

He's being courageous, practical & toughtful.

What's "disappointing" about that? Why would you give him with the qualified 73? Both comments say more about you than him.

Probably true. And he will probably have the advantage of not needing
to bother with getting a license to transmit. I'll concede your points
and go back to living for the here and now, rather than for our
eventual doom. It just seems like some almost eagerly anticipate the
latter, which bothers me. I'm sure I'm way off base.

Unqualified 73's to you both.

Sorry about the snotty remark re the corpses. I hope you found that
objectionable, despite your lack of comment :)

Nomad's points are well taken by me. But what would you hope to do
in such a situation? I have no idea where you live, but many natural
disasters occur short of a nuclear attack in which amateur radio
operators can be helpful. Are you a ham? Given your interest in radio
communications- if you aren't, I'd encourage you to become one. Part
of being prepared is practice. Getting licensed is part of that
process at the present. And you might enjoy they casual,
non-emergency QSOs in the meantime.

After all this, I have to vote for the R-388 / 51J. No product
detector, but a really nice radio :) With a real radio dial :)

Take care,
Dale

Actually the Collins designed R-388/51J series of receivers was a predecessor design to the Collins designed R390A. See:

http://www.r-390a.net/

I had a 51J-3 & sold it because it was not in the same league as my R390A. IMHO, my HRO's, Hammarlund Super Pro & Drakes all outperformed the 51J by considerable margins.

The 51J is a good looking radio though. But IMO the performance doesn't live up to the looks & the mistique.

Yeah, true. I regularly transmit on, say, 3.5MHz while one of the receivers
is tuned to Shanwick AT control on 5.599 without any problem, but then
that's a bigger separation and I'm only running a few watts normally.

Skip the receiver and get a KWM-2. Receive performance is not as good
as the R-390, but it will work fine out of band (they used to be the standard
State Department issue rigs at foreign embassies) and they are a lot easier
to work on. Also, it's a lot more convenient to use.

>When that happens, much of the solid state gear (radios, computers, cell

Note that a lot of the newer solid-state military gear was designed with
EMP-hardening in mind. You can look for something like the Trans-World
sets (which replaced the KWM-2 at embassies) for example.

I would worry more about long-term maintenance. The R-390A is a wonderful
rig and a great performer but I would not want to have to work on one.

I'm sure that II and III could be verified as having been written after
reading microfillm copies of old magazines. I doubt that anyone could
come up with the origin of the term Boatanchor however. Who was the
first guy in supply to have uttered that or more coloful descriptives
as they hoisted them onto 6x6 trucks some place in the pacific.

Well it is documented as 1956
Do you have a previous documented date ??

Many things are uttered thruout the ages but origins are typically sited
from a documented source

Yes, it is, but it has a point contact diode balanced modulator/demodulator.
EMP would kill one in a heartbeat.

Well, that was my point. It is all but impossible to tie phrases like
Boatanchor back to the who it originated with. Sure we can find a
magazine where the phrase appeared, but who knows where the author
heard the phrase.

The most we can say right now is that 1956 is that is the earliest date
we have found the phrase Boatanchor in print. It is not in any way
synonymous with the origin of the phrase.

Let me enter the fray just once more. Although I did not fall off the onion wagon recently and have been at all this for a while now, it was not until contemporary times that I came to really appreciate the R-390A. Yes, I knew they were tough birds, well designed, and had worked on them from time to time but I did not realize their full potential until I got on the air with the components of a GRC-26D. On 75 and 40 meters, and at all times of day and night and in conditions of severe QRM and N, my R-390A's have provided nothing short of outstanding service. I cannot say that of many of the others I own.... One simply will not lose money nor be dissatisfied by investing in a good one!

Well, yes. When functioning as a demodulator, the diodes take the
IF frequency (455KHz), and the BFO frequency (453.65/456.35KHz), and
make audio. When functioning as a modulator, the diodes take the
audio, and the BFO frequency, and make modulated IF.

A 1N4007 cannot switch at even audio rates, let alone at 455KHz.

Okay, so we need a fast Schottky diode, with outrageously high breakdown
voltage. Something like that has to be out there, right?

Shottky, and outrageously high breakdown voltage don't go together.

What you think of as a normal diode is a slab of P, and a slab of N
semiconductor bonded together to form a junction. A shottky diode
is a slab of N semiconductor fused to a piece of metal. 100V is a
really high voltage for a shottky diode.

What you could do, is put some of your favorite diodes in a metal can,
and install them after your radio has died from EMP. Something which
will never happen anyway.

I see there will always be those people that can predict the future. The No Code is just going to bring in Bank Robbers, Rapist, and thieves, Murder's. Wife beater's, And the MOB.
Come on grow up children. You learned the Code and that's just Great, but do you really really have to pick on those that didn't have too..... like they should be lower than life and feel dirtier then a used pair of underwear. You are not showing your Intelligent as little people. When you could be there to help them feel like they had joined up with a great bunch of people. What are you a big bunch of Whiners. Your sounding more like your mad you had to learn it,and your pi$$ed off that they didn't. You don't own the Hobby of Ham Radio!!!!!!!!!!!!!!!! Your suppose to be the best part Of it. Not the worst part... Get a life your acting like it will be the end of the world.
Get involved in a real cause ,like people trying to take away your right's. Like the right to bear Arm's, and the right to live in a good and just community. And not one riddled with crime, and Murder. These are just good people wanting to talk on the Ham Band's. Not everybody wants to be a Radio operator. The people that will come into Ham Radio will be people that enjoy talking on the Radio, and if they don't they'll leave and go on to newer and different thing's... Your just trying to be a group of elitist... You don't OWN HAM RADIO PERIOD!!!!!!! Get over it Grow up and get a life. Do something get along for once. You don't have some big CLICK going on here. Anybody that can pass the test's is an OPERATOR!!!!

Tough Crap. It's a License to operate on Ham Band's. The same as it is to have a Driver's license to drive on the Highway's. You don't have a say in it. It's ran by the Government and that's that. Your just not going to be SPECIAL ANY MORE AND YOUR CRYING ABOUT..... STINKEN WHINER'S. What do you get if you put a Whiner on one end of a Teeter Totter and a Queer on the other..... NOTHING !!!! Nothing neither one knows when to SHUT UP...

Thank You for letting me say my peace. I know there a Great Hammer's out there. And you just don't hear them Bitching all the time.
I LOVE ROCK & ROLL. AND beautiful FAST woman Too.. HHHAAAAA HAAAA You got to love it.. It's called LIFE.

Jimmie

I did ... but saw nothing to be gained by commenting. :-)

> Are you a ham? Given your interest in radio
> communications- if you aren't, I'd encourage you to become one.

I have an interest in doing that but it's only really limited. I'll probably do it sometime this year. I do a lot of listening, but the fact of the matter is I don't like to talk much. And I really think the modern ham licenses have been dumbed down (no, I REALLY don't want to start another thread on that topic, though). Whenever I have any doubts about that, I go listen on 3910 for a while. :-(

I have received the "now that there's no code requirement anymore..." speech but the fact is I could have passed the old Extra code test (20 WPM) in my sleep, back in the day. Nowadays I'm only comfortable around 15 or so.

So get a ticket and work CW. There's not any 3910 stuff there... ;)

Or AM.

AM attracts a different breed of operator. You'll find them to be (for
the most part) gentleman who appreciate a real conversation.

With the new voice allocations, AM activity will increase.

Probably not due to nuclear effects, but I have sadly seen lots of radio
gear destroyed by RF on grounds from nearby transmitters when antenna lines
failed. Not to mention my personal favorite, the radar that wasn't supposed
to be pointed toward the radio shack. The R-390 wouldn't be damaged by
that... hell, the front end probably wouldn't even overload....

Selectivity. The crystal filter really stinks, compared with the Collins
mechanical filters.

I had a 51J for a few years and traded it up for an R-390. Ergonomically
I liked the sliderule tuning on the 51J more, and the audio quality was
better, but the mechanical filters on the R-390 were a lifesaver.

Somewhere in my papers - I have an article that came out specifically dealing with taking a "Space Patrol" type walkie talkie and placing it on "6 meters" as a QRP rig. I bought a pair to do it - and things got hectic. That became a back burner project. I still have the walkie talkies but have to dig out the paperwork.

Cecil,

Code "isn't" dead "completely", I think we all know that. I believe I am safe in saying that what this guy was getting to was - SC's vigilance to keep insulting No Code Hams OR Ham want to bes. There really IS no reason to keep that up. There is nothing we can do to bring it back - the decision has been made - whether we like it or not. Insults can only help "kill" the hobby.

I've said it before, I'll say it again - if you like it - USE IT. If not - so what!

The horse has been beaten to death - past death, now into the dust. Give it a break. I've blocked all that have supported "his" stupid remarks and argument. It has been going on for at least 6 months. IT IS OVER!

It shouldn't be that big a deal.. I know a lot of the newer ones are basically
one IC with a crystal for the transmitter and an RC tank for the receive, so
you'd have only two things to change.

"Space Patrol" looks good on a QSL card equipment line, but not as good
as "Teenage Mutant Ninja Turtles."

There was a group of us back in Boston in the late 80s doing that a
lot ... we had a big bin of the xtals, and were tuning them up for a
local 6m repeater.

I also had a simplex pair that I used to build a fun 2400 bps packet
rig.

Imminently hackable, and amazingly cheap.

Good memories.

I had the experience of using a new 51J4 along side a new TMC GPR90 in the late 50's. I loved them both, but I always had better ability to pull out a readable signal with the GPR90. For specific meet schedules I always started with the 51J4, because of it's freq accuracy. These were used for both the ham bands, and for commercial service. We also had the best of test equipment, so I did run s/n tests on them. I don't recall the numbers, but the GPR90 was better. Just as I love the SX28 for it's looks and warmth, I loved the GPR90 for it's. With room lights turned down, it was a beauty. The 51J4 is cold.

Just FYI, I also had full-time use of a new TMC GPT750 transmitter. There was nothing not to love about it, either. My little CE 10B could easily drive it to the max, but I preferred to run it barefoot.

Yeah - the biggest deal of it was changing the crystal. I think the coils
and so on - were pretty much there within reason to oscillate. Been a while
since I read the article though.

This brings to mind... the military has lots of those horrible little
AN/PRT-4A transmitters selling dirt cheap on the surplus market. They
are kind of neat because they have a 455 KHz oscillator to shift the
frequency of the crystal up, allowing you to use the same crystal for
the transmitter as you did for the (seperate) receiver.

NOBODY has documentation on these things. The LOGSA database has them
still listed as unavailable except within the military. Does anyone have
a schematic on these?

As I recall, these were issued in Vietnam for communication within units,
but were mostly famous for drawing fire with their large antennae and
for poor signal quality.

I remember reading Version III when it came out (I was a newly
licensed kid of 14.) I think that was during the era when Wayne Green
W2NSD (later founder of "73" magazine) was the CQ editor and it is
indicative of his humor. I remember that he had also done a couple of
photos in this or a subsequent issue on the actual conversion process
outlined in the article.

As to whether this is the actual origin of the term, I would have no idea and like the origin of the word "ham" to describe radio afficionados of the licensed variety, the origin is probably unprovable. Version III was at least the first time I heard the term. During my government career which had a lot to do with radio and radios, I remember cribbing this definition when I was asked what to do with a bunch of excess radio equipment. I was in Guantanamo and we had replaced a bunch of obsolete equipment. The fellows at the facility I was upgrading asked what they should do with the old equipment (a bunch of demodulators.) The regulations stated that they were to box the stuff up and send it to a Navy depot. I wanted to avoid that at all cost since every time I wanted to upgrade Navy facilities with state of the art demods, I would get messages from the "Big" Navy that they wouldn't fund the upgrades because they had over 200 of these old beasts in depots. While the "old beast" would sorta do the job, it wasn't really a demod, but rather a tunable low frequency voltmeter of 1940's vintage (this was in the early 80's) and one was required for each channel, so a 24 channel system required about 8 tall racks for installation vice a single small box for the modern equivalent. I told the Commanding Officer I could suggest two solutions...one was the "boatanchor", quite literally for the sailing club to use a mooring anchors. I then asked the CO when was the last time he had an emergency destruction drill. He could not recall ever having one, so we took these old kluges out to the gunnery range, stacked them up and put Thermite charges on the top of each stack and reduced them to molten metal and glass. In our report to the "Big Navy" we simply notated that the units were transferred to "a training function" and would not be returned to depot.

Of course, Collins likely had a good reason for using solid state
diodes there.

Far lower current consumption would be one thing.

The semiconductor diodes also make it smaller.

But also balance. I'm sure it's far easier to keep a balanced modulator
balanced when using semiconductor diodes than two tubes each supplying
two diodes.

If you were to use any tubes at all, it would be best to use one tube akin
to the 6be6, hang the oscillator and the product detector ckts on it, and
have the advantage of getting conversion gain instead of loss.

A lot of people 'flip' items on eBay.

I've been watching HR receivers and transmitters for two months. A large number of identical radios are posted from 'power' sellers. The photos look amazingly similar to those posted several months ago.

Buy it today, sel it tomorrow for a profit. [AKA 'FLIP']

How so? The diodes in a KWM2/2A are used as a ring modulator, and
work just as I described below. A 1N4007 would not be capable of
working that way at 455KHz.

I'd thought of that after I posted. It's easy to lose track of things,
and really, the 6AL5 suggestion was that.

Yes, once you take out the semiconductor diodes, there are better ways
of solving the problem than putting in tube diodes.

On the other hand, it's easier to imagine someone modifying the KWM-2
than the R390, which proves the point of whoever suggested the KWM-2.

I had the 51J-3/R388 so I can't speak to the J-4 which has the
mechanical filters.

I always wanted one of these as a mate to my 32V2. I always thought
that they looked like the quintessential boatanchor receiver.

The max bandwidth on mine (6KC) wasn't really wide enough for great
audio on AM
& with no product detector, it was not good for SSB. Compared to my
Super Pro (SP210), HRO's & even the Drake it had the worst audio.

Selectivity choices were limited.

Stability was excellent & that was really the radio's strong point.
Band cruising was a PITA. Lots & lots of knob turning required to get
from the low end of 160 to the high end of 10 meters.

My Drake R4A was much better for SSB, had better selectivity, was
equally stable & had better audio.
My Super Pro has far superior AM audio, a wide bandwidth choice for
HiFi AM & is a better SW bandcruiser. Same for the HRO's + the HRO's
are now my choice as the best looking boatanchor receiver with that big
round dial.

Bottom line the 51J couldn't do AM or SSB as well as my other radios, &
wasn't much fun for SW either. So out it went.

Now the R390A, that's another story entirely. Finally got one of these
recently & i find it to be a great radio. It can hear better than any
radio I've used (noise floor is lowest ever measured I believe -
143db), has 6 levels of selectivity (up to 16kc), mechanical filters,
great stability, & does great audio through the outboard HiFi.
Mechanical digital dial accuracy
& with an add on product detector it does SSB.

Seems like the R-390 has been left out. No, I do not mean the R-390A. The R-390A was designed to be a lsee expensive version of the R-390.

The R-390 uses LC filters, which can yield better audio than the 390A, with the mechanical filters. The mechanical filters also inserted a phase shift of the signal.

Best to have one of each.

I just snagged a J.L.A. McLaughlin MCL-10VBX on ebay. It's a SSB adapter like the CV-591, but earlier, probably 1952ish. I couldn't find more than a couple of NG hits referencing it.

I would love an original manual or a clean copy, and any other information that's out there about the unit, the manufacturer, McLaughlin himself, etc. I have a couple of pieces he wrote for QST but they weren't related to this product.

Thanks.

I really like all the R-388 receivers that I've had.
All worked right off the bat with no repairs, etc.
I still use on for 10 meter AM.
Easy to use!

Do you have a specific reason for making this conversion? OA2's, and OB2's are very reliable, and certainly have withstood the test of time.

If you are intent on doing this, string up some 1W zeners until you get the desired voltage. The OA2, and OB2 are good for a maximum dissipation of 4.5W, so distribute your zeners evenly until you have at least that much dissipation. (5, 30V, 1W zeners would make an OA2)

I do not want to discourage you from changing things - but the regulator tubes are quite reliable and are also a visual indicator of high voltage. They will have exactly the same heat and power usage as zener diodes, so there is no advantage to use them.

Except, of course, if you need the socket for a product detector.

They sell higher voltage zener diodes, although you will need to be able to dissipate the power dissipated by the regulator tube. You can series zeners to get the correct voltage.

217. Com One's unique Wi-Fi IP Radio launched

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-01-13 15:47:55 UTC
From: rishil <rishilbabu@gmail.com>
Message-ID: <1168703274.669496.244680@a75g2000cwd.googlegroups.com>
Source record: 9411

Com One, a European company best known for its Bluetooth solutions, has entered the North American Market with a very unique product. It's called the Phoenix WiFi/IP radio. It connects to the internet via 802.11b/g WiFi, and plays any audio that streams online in premium sound quality..

http://askwiki.blogspot.com/2007/01/com-ones-wi-fi-ip-radio-launched.html

Good Day!!

218. Offtopic inquery re: hi-pwr audio amps

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-01-13 17:38:10 UTC
From: K3HVG <jeepp@adelphia.net>
Message-ID: <XPadnRQXNrdXijTYnZ2dnUVZ_vqpnZ2d@adelphia.com>
Source record: 9412

A colleague at work wants to build a 200w hi-fi mono audio amp using a pair of 811A's. Besides using a modified schematic of the ART-13 modulator (with modern and appropriate iron), anyone know of a design book, etc. for high power audio tube amps? Surely someone out there who's been buying VT-4Cs all these years will have an idea....hi!!
Thanks, de K3HVG

219. Help with Hallicrafters HT-40

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-01-13 17:46:19 UTC
From: Antonio Vernucci <vernucci@tin.it>
Message-ID: <45a91aec$0$16149$4fafbaef@reader3.news.tin.it>
Source record: 9413

Would anyone have a scan of the HT-40 manual? No luck on google and the copy on BAMA is useless (damn djvu!)

Thanks in advance & 73

Djvu is free, and the manuals I've looked at with djvu have been good.
What's the problem?

Don

Try to download the HT-40 manual from BAMA and you can see yourself what is the problem! Simply useless.

Many of the Dejavu manuals are of such low resolution
that its impossible to read values or even see the
schematics clearly. FWIW, there are encoders to make PDF's
available free and the Adobe Acrobat reader is free from the
Acrobat site. I use PDF Creator, it appears on your computer
as a printer. Any document that can be printed can be made
into a PDF. While this freeware does not have the
versatility and editing capabilities of the full Adobe
program it works very well and produces high resolution
documents.
I don't want to be criticizing BAMA, I think its an
extraordinarily valuable site, however, some of the manuals
are truly unreadable.

Does anyone have an old Heathkit H-9 terminal they are willing to part out?

I'm after a few keyboard switches and caps (A complete keyboard assembly would be great) and parts of the EHT assembly.

Please reply via email.

Lionel...

I downloaded it with no trouble, and the manual looks good except the
schematic is a POS. Not a djvu problem - it's a bad copy job.

Is it the same keyboard that was used in the ZDOS computers that
looked like an oversized terminal with a floppy drive? If so, I have
about 20 of them.

Hi,

I have this lovely power supply wanting to be fixed up and used.

It's been modded and doesn't work right now. I'd like to return it to its stock glory.

Anybody have in their boatanchor paperwork a schematic?

Thanks!

Don

you are lucky man. On my PC the resolution is so bad that I cannot read text neither on the screen nor on paper. Neverheless I can read fairly well other djvu manuals. It depends on the selected degreee of compression.

BAMA does a GREAT job by hosting the manuals. Perhaps one could criticize those uploading the manuals that evidently do not verify quality after scanning.

I have the manual you need. I will make a good scan for you (not djvu or jpg, hi) and I will send it to the e-mail address of the newsgroup. If it does not come please advice.

BTW, I am often and often experiencing e-mail losses or bouncing, due to those stupid anti-spam filters that service providers are setting-up. We will soon remember the good old days when one could be sure that the intended recipient receives the mail.

Ah, ah.. the mail has bounced back! But it does not seem to be due to an anti-spam filter. More simply, you have not filed a valid e-mail address on the newsgroup (geek@localhost.localdomain).

If you wish to have the diagram you must let me have a valid e-mail address.

I have one, but will need to scan it, which I probably can't do for about a week.

Also, a generous member of this board sent me the Manual for the VHF version (KG-221). When I can I'll put both on BAMA with credits for where they were obtained.

245. FS: Big pile of Military Boatanchor manuals needs new home

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-01-14 22:09:11 UTC
From: August Johnson <kg7bz@kg7bz.net>
Message-ID: <12qlag86v7cpqd9@corp.supernews.com>
Source record: 9439

Hi All. I have a big pile of vintage Military Equipment manuals that are looking for a new home. Of the manuals I have online at www.kg7bz.net, almost all came from these. I'm never going to get to scanning any more, they should be in the hands of someone who'll do more with them than I am. I have a picture of the manuals at: http://www.kg7bz.net/images/P1140068.JPG. They take about 10 feet of shelf space. Shipping sure would be expensive, if someone is near east central Arizona, you'd be welcome to pick them up. I'm not looking to get lots of money, just have them go to someone who'll share them and make sure they don't go to the dump. My address is good on www.qrz.com. If you're interested, make me an offer and tell me what you'd do with them.

73,

August Johnson KG7BZ

I will say that the regulator tubes in a lot of equipment is problematic
because they are noise sources that spew RF trash all over the place. In
the Hammarlund sets they are well-shielded and decoupled at the base, but
it still would be interesting to compare receiver noise floor with and without
a zener string.

>Thanks, de K3HVG

I think he is silly and he will find that he doesn't gain very much because
of the large grid drive required for those things. He would be better off
with power pentodes than 811s.

However, if he really wants to do 811s, he should look at the many projects
in the Audio Amateur magazine and in the later Audio Express, using the 811.

The hard part is the iron, of course. But most of the folks making iron
for those applications will also provide construction notes on amps too.

Help! Does anyone have some or all of the knobs I need to complete my Hallicrafters SX-25 restoration? I need one (1) main tuning knob and three (3) smaller knobs such as is used on the "Pitch Control" and "AF Gain" controls. This style knob was also used on other 1930s Hallicrafters receivers such as the SX-24, S-22R, S-22, S-21, S-20R, S-20, S-18, S-18, S-17 and S-16. Thanks!

I need a 2.5mH choke with 500ma current capability.

I have one that looks like a typical 2.5mh but have no clue of the current.

If someone has a 500 ma one, I would appreciate knowing the resistance
so I can compare with the ones I have.

Thanks

Hi Don, Tony, and everyone else,

By all means for better copies of any ham radio manuals on BAMA,
please just send the manual directly to me. Since uploading to the
site suffers from the same limits as downloading, the most efficient
way of getting something to me is through a service such as YouSendIt
at http://www.yousendit.com . You are allowed to send files up to
100MB in size free of charge.

Incidentally, through the generosity of Lynn Bisha, W2BSN, a new scan
of the HT-40 transmitter has been placed on BAMA. It is in pdf and
the schematic is quite readable.

Finally, DjVu has never lived up to its promise. For those who live
in the Unix/Linux world, DjVu Libre makes things work inexpensively
and really quite well. However, the capitalization efforts since the
Windows rights were sold to Lizardtech have stifled the baby in the
crib. The software needed to do a "good" job of creating a djvu file
without the artifacts that you see typically in djvu files on BAMA is
not readily available. DjVu Solo 3.1 is responsible for the files
with these artifacts and is not a good solution. However, for those
djvu files that do exist, rather than using the Lizardtech plug in, I
would strongly recommend that you use the free DjVu reader called
WinDjView which can be downloaded from
http://windjview.sourceforge.net/

I do regret the listings on BAMA which contain certain unreadable pages, particularly if they are of the schematic diagram. However, when such a file is uploaded, I ask for a clearer scan. If it is not available, I usually post the file anyway on the theory that some information is better than no information. Perhaps that theory is flawed and I should just discard such files.

According to the Millen catalogue, they have a 1mH one rated for 510 mA
that has 2.9 ohms across it.

Millen sent it to me in the mail a couple years ago. They'll send you one
if you ask them for it.

Digi-Key has some of the Millen line in their book also, and is a good
general parts reference worth having on your desk.

Jack, If all else fails ,you can take a 120v to 12v transformer (120v
to 6v)connect it to a filament line ...12vac in-120vac out.this will
give you 120vdc use a doubler/rectifier circuit and get 200VDC out..
works everytime... Harold W4PQW

Hi,

Are you confusing the J.W. Miller company
and the James Millen company?

Last I heard, Caywood Electronics of Andover Mass.,
(formed by a former Millen engineeer),
was carrying on the dip-meter line, but I don't know if he
is manufacturing any of the Millen chokes.

Ed Knobloch

269. MI5 Persecution: Dirk Gently on the Toronto Case (463)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-01-18 22:26:49 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07001823211254@4ax.com>
Source record: 9313
Cross-posted to: alt.games.the-sims,rec.radio.amateur.boatanchors,esp.charla.religion,fr.soc.religion,chile.soc.religion

Dirk was on the West Coast when he got the call. An old friend at the Toronto police department thought he would like to fly up and take a look at a homicide which had occurred the previous evening. He decided to skip the last day at the World Holistics conference and take the next plane out of San Francisco.

The flight was bad; Dirk had been hit on the back of the head by the Newspaper trolley, the drinks trolley, the dinner trolley and now the gift trolley. When the hostesses weren't trying to tear his arm off they pestered him to stop leaning into the aisle - ignoring the fact that the guy next to him was taking up one and a half seats. Air Canada used to be the flight which was so good you just didn't wanna get off - on this occasion Dirk would be glad to see the back of the plane and the over sized alternative comedian wedged into the window seat.

After breathing in a couple of lungfulls of crisp Canadian air Dirk took a taxi into town. There was a small group of demonstrators outside the MacDonalds and the taxi driver insisted on stopping on the opposite side of the street. "Don't Eat Meat" the placards read and the demonstrators chanted. A couple of policemen where stopping the crowd entering the restaurant itself - one held up his arm and challenged Dirk. A wave of the fax he had been sent and the policeman pushed open the door.

There were few customers in the restaurant. Not surprising really with a demonstration going on outside, half the dining area roped off with tape and a dead body seated at one of the tables. "Mr Gently sir" the officer in charge called out as he peeled one end of the tape off a column "We were told not to touch anything til" you got here".

The body of the man slumped awkwardly in a chair. Then even a dead body would start getting uncomfortable in a MacDonalds chair after twenty minutes - and this one had been there for at least eighteen hours. Two back legs and the tail of a cat hung out of the man's gaping mouth. Dirk turned to the officer, "I suppose you are going to tell me this is the darndest thing you ever saw?"

"Ain't this the darnd...". The officer seemed annoyed that Dirk had second guessed him. "We're removing the body in a few

minutes, so if you can get through as quick as possible&#65533;

&#65533;Many people eat cats in fast food restaurants?&#65533; Dirk asked and without waiting for an answer leant over the table to pick up an untouched burger. &#65533;And what&#65533;s this?&#65533; he asked waving it in front of the officers face.

&#65533;It&#65533;s a Vedgie Burger&#65533; The waitress, who was cleaning one of the adjacent tables, shouted across. She walked over to Dirk. &#65533;We started doing them because of that lot out there&#65533; she nodded towards the protesters who were pressing there faces against the windows &#65533;They&#65533;re called Linda McCartney Vedgie burgers - ever heard of them?&#65533;

Dirk suddenly felt faint, perhaps a combination of hunger and jet lag. &#65533;This is deja vu all over again&#65533; he thought to himself. He glanced at policemen - at the badge on his shoulder &#65533;OPD&#65533; but this wasn&#65533;t Ontario this was Toronto. OPD - Officially Pronounced Dead. It dawned on Dirk what was happening, he knew what he would see if he looked out of the window. Sure enough, there it was, the Volkswagen Beetle parked across the road - number plate 28IF - 28 IF Paul McCartney had lived. And amongst the lyrics of the song blaring out into the restaurant he could pick out the words &#65533;I buried Paul&#65533;. Now it was though Dirk was viewing the whole scene though a TV screen. This was conspiracy. Not -a- conspiracy, or -the-conspiracy, but just plain conspiracy.

&#65533;You look faint - are you OK mister? The waitress asked.

Dirk shook his head &#65533;Probably a bit hungry&#65533; Then to economise on dialogue took out a pack of cigarettes and held it out towards the girl. She was about to take one but Dirk snatched the pack away, held it up to his mouth and drew out two cigarettes. He lit both then passed one of them to the girl. It was the closest he had come to a sexual encounter in three months.

&#65533;Want a Burger?&#65533; the waitress asked.

Dirk looked down at the Vedgie Burger on the table. &#65533;No thanks - just a plate of fries&#65533;

The waitress walked away and Dirk looked around the room. Apart from a family seated in the far corner there was only one other person in the restaurant - and he wasn&#65533;t eating. The guy was about mid twenties and had straggling, shoulder length hair. On the table in front of him were lots of pieces of paper cut into squares. Every so often he would pick up a camcorder and pan it around the room and then, when he was finished, speak into a microphone which was attached to a tape recorder. Dirk walked over to where the man was sitting.

The small pieces of paper had paragraphs of text written on them and were stuck to the top of table with blobs of mustard. Lines had been drawn, some solid some dotted, on the table top with a marker pen. The lines ran from one piece of paper to another.

"What are the lines for?" Dirk asked, realising straight away that "What the hell are you doing?" would be more appropriate.

"You see" The man replied nervously "The dotted lines are weak links and the solid lines are strong links. The dotted lines are things which are happening in the rest of the world and the solid lines are things which are happening to me. Now you see I draw over a dotted line, replacing it with a solid line, when I can link something back to me. Like this" The pen squeaked over the Formica and before Dirk could interrupt the man added. "You see I lost my short term memory and, as a consequence have a very short attention span. I write down, record and film everything then put it all together later"

"So" Dirk interrupted. "You filmed what happened here?"

"Yes, yes, it"s here on this tape" The man pushed the cassette across the table. On the label the words "Grassy Knoll" had been crossed through and replaced with "MacDonalds".

Suddenly the man sprung from his seat. Dirk turned and saw that the body was being removed on a stretcher. As it passed the man picked a small object off the edge of the stretcher itself. "This is important" he said, laying a blood stained bullet on one of the small pieces of paper on the table.

Suddenly the room was filled with a deafening throbbing sound as a Black Helicopter landed in the street outside. Two men in United Nations uniforms got out and collected the stretcher. Back at the table the long haired man was replacing all the dotted lines with solid ones. Dirk panicked and began to walk backwards at some speed. Barging through the swing doors he stumbled into the kitchen, tripped and felt himself sink slowly into a large vat.

"The guys fallen into the batter" Dick heard someone shout before he sunk below the surface. He came to sitting in a chair with the batter solidifying all over his body. He surveyed the room through two eye-holes someone had cut. Suddenly the chair on which he was sitting was picked up carried through the restaurant and out of the building. As the chair was being lifted and put into the back of a van, Dirk caught a glimpse of the waitress following him. "Your fries mister, your plate o..."

The doors of the van shut and Dirk tried desperately to steady himself as it sped across town. Eventually the doors flew open and Dirk was flung into the road at which point the solidified batter shattered and set him free. Standing up he found himself outside the international departures terminal of Toronto airport.

In the departure lounge Dirk had time to reflect on the day's events. He had got caught up in the conspiracy theories and the haphazard welding together of pieces of irrelevant information. It was time to catch the person who was operating the bizarre cognitive engine which appeared in front of him like a fairground mirror, distorting any flaw it could find in his own, fragile, map of the real world.

Dirk leant into the aisle of the plane as it took off for London. The oversized person next to him swung his arms violently as he complained about every thing from the supper in a plastic tray to the state of British politics. With a shaven head and a badly fitting suit the man looked as though he could have worked behind the reception desk of the Kremlin. However when he spoke he did so in a Liverpudlian accent. "Me I blame the Con-serv-a-tive government, me. The Tour-rees. That-cher. Me. They need a good kicking" He jerked his feet forward and struck the seat in front with his Doc Martins. "With these. Me Doc Martins. Doctor Martin's, Doctor Martin's, Doctor Martin's Booots!" The phrase was now being sung over and over again as the man writhed in his seat and clicked his fingers.

Dirk looked down at the boots and thought of the reaction most people used to deal with the paranoids at the end of the wire. A nice quick kick. "Oi nutter - get some therapy". This is the easy way out and perhaps the safest. After all there you are sat, alone, in front of the screen. No body language between you some paranoid. No way of telling if he really is some gibbering psycho. Look at it too long and you be drawn in. Fall into the tangled database of weird links with him. Who knows he may be watching you, reassembling and linking your experiences with his. How sure are you of you own cognitive threads. After all cognition is only a bug fix for a neurological system which was designed in a hurry - it's abused by everyone from politicians to advertisers. If people really can convince each other that a bottle of washing up liquid is as exciting as an orgasm using just television God knows what they can do with a computer. Better to avoid the risk. A swift kick. After all if you're Homophobic you put the boot in because you are scared of any ambiguity in your own sexuality - why not be Nutterphobic as well.

Although Dirk would have liked to devoted time to tracking the culprit down he decided to let it rest. The Internet changed over the next twenty odd years. A lot of the people who used it went out and got lives. And those who already had lives burnt them away. The number of users had dwindled after someone had invented a C++ program, with truth as a variable, to deal handle politics and government. Dirk had already retired from finding old ladies cats with the help of obscure science when he got another call from Toronto.

It was 4th March 2025 when he booked onto the Air Canada flight from Heathrow. The silver haired woman in the seat next to him painted bright red lipstick around her mouth. "Of course it was no surprise to be offered the job after Claire Raynor retired" she sneered" After all I used to be a psychiatric nurse... Now if Blokes had periods they would understand..."

By chance the taxi ride to Toronto mental hospital took him past the MacDonalds - where the whole thing had started. Of course it was barely recognisable having become a Church Of Scientology Vedgie Bar. Police in riot gear kept the two sets of demonstrators apart. Dirk didn"t really know what to expect when he got to the hospital. The girl at the reception desk directed him to a row of chairs in a wide well lit corridor. There was a strong smell of disinfectant, the furniture and the carpets were immaculately clean and behind the rows of teak veneer doors the "nutters" were all safely locked away. For some reason Dirk started thinking about CompuServe forums.

A tall blond woman in a white coat approached. "Mr Gentle, I assume"

"Yes" Dirk replied shaking her by the hand. "You"re the nurse who..."

"Doctor" She interrupted, "Doctor Killfile" She led Dirk across the corridor towards one of the doors then stopped with her hand resting on the handle. "Now you know about this person don"t you?" and after Dirk nodded she continued "Don"t tell him anything about yourself - don"t let him get into you head. If he does he"ll screw it up"

The door opened to reveal a frail man sitting in from of a TV screen. He had a keyboard on his lap and next to the television was a computer screen. Dirk glanced at the walls of the room and remembered that his settee at home need upholstering. The nurse left the room and the man looked up "So you come to my daughters wedding and ask me to kill a man" he said in a dry cackling voice. "Look" he continued, pointing at the screen, "I know that man. They"re talking about me now -

listen&#65533;. The man stared at Dirk. &#65533;What&#65533;s your name? Are you one of my friends from the Internet? - Are the lambs still screaming Dirk?&#65533;

Dirk, at first recoiled in horror, then felt a sense of anti climax. So this is what they hyped up to superstar status on the back of their own fears of madness. Dirk was reminded of the film &#65533;A day on The Beach&#65533; where a submarine had set off to search a post nuclear World to track down a signal coming from a remote military base - only to find it was being sent by a Coke bottle half balanced on a Morse tapper. Outside the room the nurse waited for him. Because his nicotine craving had returned - and to avoid an awkward piece of dialogue - Dirk turned to her and asked . &#65533;Patch?&#65533;

Dirk took two nicotine patches from his wallet the first of which he stuck onto the inside of his arm. Stepping closer to Doctor Killfile he opened her white coat and slid his hand into the opening at the front of her dress. He pressed the patch onto her leg as close to the top of her inner thigh as he dare. She took a deep breath and then slowly breathed out. &#65533;What Bogart could have done with these things&#65533; Dirk thought to himself.

&#65533;Is he crazy?&#65533; Dirk asked tilting his head back to towards the door.

&#65533;Who knows&#65533; Doctor Killfile replied &#65533;We let him type away. He sees something on the TV in the morning and it keeps him busy all day. What he types doesn&#65533;t go anywhere it just stays on a mainframe in the basement. It can be read by anyone else in the building but that&#65533;s it. We got them all in here conspiracy theorists, racists, nationalists. They&#65533;ve created a world within a world really...&#65533; Her voice trailed away and she stared down the corridor for a while then added &#65533;So long are two things are different neither will come to be in the other and so become at once both one and two.&#65533;

Dirk gave her a puzzled look &#65533;You mean their brains are fried?&#65533;

&#65533;Fried?&#65533; Killfile smiled at Dirk &#65533;No that was Plato&#65533;. Then the smile fell from her face. &#65533;You must remember, mister, plate o...&#65533;

Mike Corley FAQ
version 0.1
first edition 5th May 1996
last updated 5th May 1996
Iain L M Hotchkies iain@XXXXX.demon.co.uk

Mike Corley is a 'net personality' who has been active on the following newsgroups (uk.misc,uk.legal,uk.politics,uk.media,soc.culture.british) since....? Well, at least as far back as the summer of 1995.

He posts long tracts, the tone of which approximates that which one might expect from a reasonably intelligent paranoid schizophrenic.

No details are known of Mike's 'real' personal life or background. Once would presume that he came from a reasonable family and was reasonably well educated before the first symptoms of schizophrenia began.

Schizophrenia: Clinical features
(from the Oxford Textbook of Psychiatry, 2nd Edition)

The acute syndrome

Some of the main clinical features are illustrated by a short description of a patient. A previously healthy 20-year-old male student had been behaving in an increasingly odd way. At times he appeared angry and told his friends that he was being persecuted; at other times he was seen to be laughing to himself for no apparent reason. For several months he had seemed increasingly preoccupied with his own thoughts. His academic work had deteriorated. When interviewed, he was restless and awkward. He described hearing voices commenting on his actions and abusing him. He said he believed that the police had conspired with his university teachers to harm his brain with poisonous gases and take away his thoughts. He also believed that other people could read his thoughts.

This case history illustrates the following common features of acute schizophrenia: prominent persecutory ideas with accompanying hallucinations; gradual social withdrawal and impaired performance at work; and the odd idea that other people can read one's thoughts.

In appearance and behaviour some patients with acute schizophrenia are entirely normal. Others seem awkward in their social behaviour, preoccupied and withdrawn, or otherwise odd. Some patients smile or laugh without obvious reason. Some appear to be constantly perplexed. Some are restless and noisy, or show sudden and unexpected changes of behaviour. Others retire from company, spending a long time in their rooms, perhaps lying immobile on the bed apparently preoccupied in thought.

The speech often reflects an underlying thought disorder. In the early stages, there is vagueness in the patient's talk that makes it difficult to grasp his meaning. Some patients have difficulty in dealing with abstract ideas (a phenomenon called concrete thinking). Other patients become preoccupied with vague pseudoscientific or mystical ideas.

When the disturbance is more severe two characteristic kinds of abnormality may occur. Disorders of the stream of thought include pressure of thought, poverty of thought, and thought blocking. Thought withdrawal (the conviction that one's thoughts have been taken away) is sometimes classified as a disorder of the stream of thought, but it is more usefully considered as a form of delusion.

Loosening of association denotes a lack of connection between ideas. This may be detected in illogical thinking (knight's move) or talking past the point (Vorbeireden). In the severest form of loosening the structure and coherence of thinking is lost, so that utterances are jumbled (word salad or verbigeration). Some patients use ordinary words in unusual ways (paraphrasias or metonyms), and a few coin new words (neologisms).

Abnormalities of mood are common, and of three main kinds. First, there may be sustained abnormalities of mood such as anxiety, depression, irritability, or euphoria. Secondly, there may be blunting of affect, sometimes known as flattening of affect. Essentially this is sustained emotional indifference or diminution of emotional response. Thirdly, there is incongruity of affect. Here the emotion is not necessarily diminished, but it is not in keeping with the mood that would ordinarily be expected. For example, a patient may laugh when told about a bereavement. This third abnormality is often said to be highly characteristic of schizophrenia, but different interviewers often disagree about its presence.

Auditory hallucinations are among the most frequent symptoms. They may take the form of noises, music, single words, brief phrases, or whole conversations. They may be unobtrusive or so severe as to cause great distress. Some voices seem to give commands to the patient. Some patients hear their own thoughts apparently spoken out loud either as they think them (Gedankenlautwerden) or immediately afterwards (echo de la pensee). Some voices seem to discuss the patient in the third person. Others comment on his actions. As

described later, these last three symptoms have particular diagnostic value.

Visual hallucinations are less frequent and usually occur with other kinds of hallucination. Tactile, olfactory, gustatory, and somatic hallucinations are reported by some patients; they are often interpreted in a delusional way, for example hallucinatory sensations in the lower abdomen are attributed to unwanted sexual interference by a persecutor.

Delusions are characteristic. Primary delusions are infrequent, and difficult to identify with certainty. Delusions may originate against a background of so-called primary delusional mood - Wahnstimmung. Persecutory delusions are common, but not specific to schizophrenia. Less common but of greater diagnostic value are delusions of reference and of control, and delusions about the possession of thought. The latter are delusions that thoughts are being inserted into or withdrawn from one's mind, or broadcast to other people.

In acute schizophrenia orientation is normal. Impairment of attention and concentration is common, and may produce apparent difficulties in remembering, though memory is not impaired. So-called experiences result from illness, but usually ascribe them to the malevolent actions of other people. This lack of insight is often accompanied by unwillingness to accept treatment.

Schizophrenic patients do not necessarily experience all these symptoms. The clinical picture is variable, as described later in this chapter. The table below lists the most frequent symptoms found in one large survey.

The most frequent symptoms of acute schizophrenia (World Health Organization 1973)

Symptom Frequency (%)

Lack of insight 97
Auditory hallucinations 74
Ideas of reference 70
Suspiciousness 66
Flatness of affect 66
Voices speaking to the patient 65
Delusional mood 64
Delusions of persecution 64
Thought alienation 52
Thoughts spoken aloud 50

Various theories exist about Mike Corley:

1) he exists and is disturbed and has net access and for reasons uncertain spams a selected number of newsgroups on a regular basis - if you are reading this FAQ then you will almost certainly have seen

one of his posts.

2) Mike Corley is a 'virtual schizophrenic'. Mike displays the relevant features so well that some people think he may be a construction of one or more people with intimate knowledge of mental illness and the mentally ill. Perhaps they wish to monitor the effects on the internet of the posts of a schizophrenic. Moving into X-Files territory a bit, ourselves, here.

Mike's posts attract different responses:

1) cruel, humourous, dismissive posts from those who've seen his posts many times and have become generally irritated by his behaviour while accepting that he probably has a mental illness.

2) posts from Corley-newbies - those who have come across relateviely few of Mike's posts. These may be humorouous or disbelieving.

3) posts from people who have been sucked in (for one reason or another) into Mike's Wild & Wacky World (TM)

That's enough for now.

Persecuted by the Security Service

Since June 1990 the British security service MI5 has waged a campaign of harassment against a UK citizen,
through the broadcast and print media, verbal abuse at work, and molestation in public and during travel.

Despite widespread knowledge of the campaign in the UK and discussion of its characteristics on Usenet for
over three years, it continues today both in Britain and North America. Its cause and basis is xenophobia
on the basis of the genetic accident of mental illness, coupled with discrimination against an inferior
"foreigner" whom they condemn as "not up to British Standards".

If this is your first visit to this site, please read the FAQ first. Feel free to contact the author with
any questions.

Frequently Asked Questions article outlines the parameters of the persecution. Who is involved, and why?
What technical and social means do they employ? What response have I made, and why has their campaign yet
to be exposed?

The UK Security Services which are believed to be behind it all. Domestic security is the province of MI5
while the secret intelligence service MI6 combats foes (and its former employees) on foreign shores.

Usenet archive chronicling the (sometimes very enthusiastic) exchanges which have taken place on UK-local
newsgroups since May 1995. Make your mark on the continuing discussion!

Believe it or not, a few items of evidence have been recorded. Although none of them is particularly
conclusive, by presenting them I hope to explain what I understand from some television and radio programmes.
Most of the "clinching" material was aired in 1990-92, and no recordings exist now, which is quite unfortunate.

My complaints to the BBC and MI5 (via the Security Service Tribunal and Interception of Communications Tribunal),
and their response to my challenges, are recorded here. Basically they deny everything, they have put their
denials (mostly - Buerk and Lewis refused) in writing, and I don't believe them. Part of

the website also
documents media coverage of my campaign to expose the persecution.

Faxed articles to, and responses from British organisations including Parliament and UK media. Over 24,259 faxes
in all were sent from 1998 to 2000. Their aim was to boot discussion of the persecution into the public domain,
and that aim was not accomplished.

20,000 Reward Offered to Expose the Conspiracy

I am making a pledge for information directly leading to the exposing of the "BBC Newscaster
Conspiracy". The exposing would specifically need to lead to a legally binding admission from Martyn Lewis
or Michael Buerk of the BBC they they were watching me through the TV set.

I would be happy (delighted, in fact) to pay GBP 20,000 sterling in reward for the above admission.

For my sins I had a look and it's quite good actually. Nicely set out and
presented. Didn't read it though, having read the rants a million times
before. By the way, anyone noticed Chris Tarrant looking at you funny
during Man O Man yet? Thought not...

Now, whatever you might think about the content, this is a very well designed and presented web page (if you use Netscape to look at it anyway - Mosaic couldn't handle it).

This is my article, not my employer's, with my opinions and my disclaimer!

This weekend is the annual St. Joseph, MO. hamfest!
It is just north of K.C. on I-29 at exit # 47 at the Holiday Inn.
The event starts around 8 am saturday (around 6am for flea market set up).
It is a wonderful show that is growing better each year so load up all your
gear and come sell it this saturday.
There will be all kinds of vendors selling new radios, antennas, and all
kinds of ham radio products.
See your there!

Hi,

Or a doubler on a shaver isolation transformer. Available by the boxload
at most thrift stores for a buck or so each.

Cheers!

I do actually have a 1972 Millen catalogue here somewhere too, but
the Miller catalogue is a lot easier to get to.

Also I will recommend Renco in Florida as an excellent source of unusual
chokes.

I have 2 in mind: the Rohde & Schwartz EK-07 - It works great on SSB as
well, but R & S made a sideband adaptor for it, and the Siemens E311,
which has a built-in product detector and selectable sidebands. It is the
last generation of high-end professional receivers with tubes.
The EK-07 outperforms the R-390A, but it's more complicated to service.
The Racal RA-17 or RA-117 are not bad, but not as good as the first two I
mentioned.

284. 0.125" and 0.156" pins for 7-pin tubes.

Newsgroup: rec.radio.amateur.boatanchors

The Molex 0.093" pins work great for wiring up tubes with octal bases or the same size pins (like CRTs), but I can't seem to find 0.125" and 0.156" similar pins for those old style 7-pin tubes.

Anyone know of a source, or someone who still makes the socket pins (I've check Keystone, Amp, Molex and a few others). I prefer the pins to the sockets as it makes the wiring easier (in my case CRTs).

TIA,

Steve.

While the Rohde & Schwarz stuff is legendary (there is also the EK11-10 which has USB/LSB operation), it is also difficult to service and hard to find.

This cannot be said of the R390A, but just in case, you might get two of them and then be able to troubleshoot (and keep it up and running) by swapping modules. The rx has the added advantage of having a large devoted following, with ensuing mailing lists, documentation, availability of tubes and spares, friendly help, etc. And then add the Sherwood Engineering SE-3 Synchronous Detector to it for great SSB and general listening pleasure.

It would also be good at handling transient peaks, as well as stable enough to run RTTY and other utility modes.

My 0.10 Euro...

Best,

Clemens S.Ostergaard
Aarhus, Denmark

PS: Of course there is also the robust Chinese tube receiver 339 from 1976, being offered NOS over ebay, and getting a good review in E-ham.

And the Eddystone 880/2 is a superior tube receiver, which is so intensely screened and doublescreened that nothing gets in (or out) except through mains and antenna.

Look at the crimp pins used on the Amphenol Series 96 connectors and
see if you can't make some of those work. There are a wide variety
of sizes and they are very reliable. They get used for all kinds of
things.

If that doesn't do it, try the Concord catalogue. I think I saw some
machined pin sockets in there. I don't think Mill-Max makes anything
big enough.

Those sizes are commonly used on older (1970-1980) pinball machines.
I found some at Fry's Electronics.
Otherwise try pinball parts dealers.

The Bendix ADF-T12-series direction finders are the Bendix
transistorized version of the old Motorola ADF-12. Any General Aviation
radio shop will have a book on this radio. The I.F. frequency is 140
kHz. The schematic set is a bit involved to scan, but the rear panel
Amphenol Blue-Ribbon connector pinout is as follows:
Pin 1 Sense antenna
Pin 2 Loop shield
Pin 3 Loop Input R1 (Tin)
Pin 4 Loop Input R2 (Copper)
Pin 5 Optional Audio Amp A+
Pin 6 Dial Lamps
Pin 7 Tuning Meter (ext)
Pin 8 47Hz switching Phase 2
Pin 9 Ground
Pin 10 Servo DC Output
Pin 11 Spare
Pin 12 47Hz switching Phase 1
Pin 13 Servo DC Output
Pin 14 Headset (500 ohm)
Pin 15 DC In +
Pin 16 ADF Servo Signal Output

The manual set I have is for the ADF-T12D with synthesized tuning. The
12B and C are infinitely more reliable than the D-model.. which is a dog!!!

Good luck with the project. de K3HVG

Let me also add the following... In order for the system to function, one would need the 2321E loop antenna, the special (balanced)loop antenna cable set, and any of the 551-series servo amplifier/indicators. Without these items, one simply has a LF/MF receiver. For listening, simply connect A+, ground, headphones, and a wire antenna to the sense antenna input. Input voltage (12v or 28v) is rear-panel selected. No internal changes are required.

Many of the old tube ADF sets were repurposed for boats years ago and
they did not hold up terribly well especially on salt water. Both the
Motorola/Bendix and King Radio units are very desireable for BCB DXing
today. Avionics shops will sometimes give you them if you ask properly
along with old dynamotors and such.

Good afternoon, Ed.

The 19" wide is the panel (standard 19" panel width), right?

Won't the cabinet be a bit wider than that, perhaps 1/2 to 1 inch wider each side?

307. Re: Dimensions (footprint) for HQ-180

If you take the cabinet off, leaving the receiver and the front panel, it will slide into a standard 19" rack opening. The left and right sides of the front panel will hide the side rails of the rack. I have a "rack-mounted" HQ-180AC, here. It sits on a shelf within the rack and, with the exception of the rounded corners of the receiver front panel, it appears like a custom fit. One other consideration is that the "standard" height for many/most MIL and Commercial receivers (R-390, 390A, SP-600, R-274/SX-73, et al is 10 1/2". The HQ-180-series receivers, and in fact the other large cabinet Hammarlunds will fit this rack size. Note also that, unfortunately, the above Hammarlund receivers will NOT fit in a rack with the cabinet, in tact, unless the rack side mounting rails are removed. This can be done in some racks; others, not.

I have an exceptional HF-380. It is loaded with filters, NB, Speech Processor, Keypad, and manual.
This one has very few hours on it. It belonged to Bell Helicopter Avionics Dept in Ft Worth/Dallas branch. I know the fellow who convinced the supervisor of the dept to order it.
The supervisor did not like it and it set on a shelf for most of its life. It is Mint. Not a marke inside or out. Works perfectly except for an ALC problem.Should be an easy fix. I wont $3500 for it. If your interested and want to know more about it or talk to the retired Bell Helicopter employee who knows its history. Let me know. I am selling off some of my prized collection that I just dont use. Thanks, Charlie Hugg, K5MBX, CCA3307

==========
The outside cabinet width is 19" including the "rim." The full depth
is 13" and the height including the "feet" is 11". Without the feet,
the height is 10.5". --Ed

Randy,
I have both a 170C and a 170AC. The audio of Hammarlunds is not that great but certainly usable for a vintage station. The HQ-170 uses a tube rectifier, vs solid-state in the 170A. The A model also has an SO239 coax connector and a flip-up cabinet top. Beyond that, there's not a lot of difference.
If the fuse is not blown, the rig is probably OK to fire up, as-is. If you have a Variac available, its always a good idea to bring it up slowly the first time. Problems will probably be alignment. The 170/A is triple conversion and if someone has been hacking at the alignment, there's no telling how well it will, or won't, perform. One failure mode is the 2.58 MHz oscillator. If the upper bands are dead, look into that part of the circuitry. Its been my experience with 4-5 of these that power supply problems and receiver alignment are the bugaboos. That, and the crystal oscillator. Fortunately, Hammarlund didn't use any of the nasty types of paper caps. In fact, most are disc types.
If the receiver is in nice physical condition, I'd say you may well have a keeper. I use one with a Viking Valiant I and find it just fine on 75 and 40 meters. If yours doesn't have a clock, they can be had from after-market sources. That goes for the clock lens, too. Oh yeah... Hammarlund dials have a habit of really smoking up (getting very dirty). One can remove the front panel fairly easily (more info if you need it) and it will really brighten things up!

Good luck with your project.

315. FS: Brim Electronics LARGE Feedthrough Insulators

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-01-23 23:13:27 UTC
From: Dave Goncalves <davegoncalves@gmail.com>
Message-ID: <1169594007.284805.165430@a75g2000cwd.googlegroups.com>
Source record: 9259

Hello Folks,

I have purchased a lot of 10 Brim Electronics 6-77 Feedthru Insulators (minimum order). I now have 4 surplus to my needs. I am offering these on eBay starting 'at cost' ($12.75), plus shipping from Danvers, MA (UPS, FedEx, USPS OK).

These are NEWLY MANUFACTURED UNITS - NO MISMATCHED JUNKBOX CRUD. No cracks, chips, or 'glue'. These beefy 3 1/2" long, 1 1/2" diameter parts are truly built for the job. They are perfect for replacing transformer feedthroughs, coil standoffs, antenna feedthroughs, or as the base for a Jacob's Ladder.

Each Feedthru Includes:

(1) 5" Long nickel plated brass rod, 1/4-20 thread
(4) 1/4-20 nickel plated brass nuts
(4) washers
(1) Porcelain Feedthru Set (6-76 Upper Section, 6-77-B Bottom Section)
(2) Cork Washers

Please see:

http://cgi.ebay.com/Large-HV-Porcelain-Feedthru-Insulator-NEW_W0QQitemZ200071665372QQihZ010QQcategoryZ1502QQssPageNameZWDVWQQrdZ1QQcmdZViewItem

Or search for "Large HV Porcelain Feedthru Insulator"

$12.75 plus shipping is the starting bid - this is AT COST - I am just trying to make most of what I paid.

Yes, these are expensive when compared to stuff you can get surplus - but sometimes you can't find what you need at a hamfest, and you can't forget the cost of gas and food...

But, if you clean the dials, do not use window cleaner. Be careful with the lettering as it is very difficult to put back after it is washed off.

In truth, none of these old receivers compare to the newer ones - and they probably are chosen on aesthetics. If you like the looks, it is a good radio.

Hello,

Just took apart a chassis for some of the components for a project - it
was originally built for an oscilloscope. Offering the removed
transformers for peanuts above the shipping cost. Will also deliver to
Hosstraders.Will trade or give away for good reason.

CHICAGO TRANSFORMER R-8300 Choke 8A 300 mA $15
2 Units - CORNELL-DUBILER PC2549G - 4 MFD 2kV
$10 each
THORDARSON C.H.T. Transformer T-11F60 6.3V 5A Nice Round Shell $7
KENYON Transformer S-13336 2.5V 1.75A, 6.3V 0.6A, 2500V $5
TOBE 3 x 0.2 MFD 4kV
$5
TOBE Oilmite RAL-300 2x 5MFD 400 VDC 71Deg C
$2
TRIAD F-72Z 2.5V 5A
$2
UNKNOWN MFG 2.5V FIL TRANSFORMER ~10A $2
THORDARSON 21F02 2.5V CT, 10A
$2
THORDARSON T-45557V unknown choke
$2

Or buy the whole set for $42 dollars.
Prices do not include shipping.

Shipping from Danvers, MA by USPS, UPS or FedEx. Most forms of payment
accepted.

PM or email

I owned an HQ-170C a few years back. As I recall, the small capacitors were most or all ceramics, so you won't have to replace a bunch of leaky paper caps.

I would recommend replacing the electrolytic capacitors, however. After about 40 years, they are probably either shot or about to fail, whether or not the set has been used. And the consequences of a power supply failure can be expensive.

This article gives some basic information about recapping:
http://antiqueradio.org/recap.htm .

Especially if it has been sitting unused for years, the receiver will also benefit by cleaning of the controls with a good spray cleaner such as DeOxit. Don't forget the bandswitch.

Regards,

Phil Nelson

From: COLIN LAMB <k7fm@teleport.com>
Message-ID: <IFBth.14718$w91.12084@newsread1.news.pas.earthlink.net>
Source record: 9266

The HQ-170 was the packaging of the HQ-110 and the HC-10. The HQ-110 was a rather ordinary, but small and compact, amateur band only receiver. The HC-10 is a nice if adapter that converts the normal 455 kHz if to a much lower frequency, then adds a product detector. The HC-10 is highly sought after. Selectivity can be quite narrow, and it has a product detector, which a number of other old boatanchors do not have.

The main limitations of the HQ-170 would be stability and frequency readout on 10 and 15 meters. Since the high frequency oscillator is close to the ham band, drift is more of a problem than with the receivers that have a crystal controlled front end. But, on 80 or 40 or 160, who cares. Stability is ok there.

IF bandwidth is wide enough for good am, but some audio engineer came up with the bizarre idea to vary the fidelity of the audio output depending upon the avc voltage. It was called "Auto-Response" and assured distortion when there was qsb. The fact that they promoted it rather than hiding it never did make sense.

My neighbor had one and worked a hundred countries on sideband with it and probably 50 countries on 6 meters am, so it was good enough.

Each of these old receivers has their qualities and quirks - which makes them almost human.

73, Colin K7FM

Didn't the differences with the HQ-170A include the fact that they
added a separate filament transmformer or perhaps just kept the power
transformer live (don't remember which), in order to run the VFO tube
filaments on a continuous basis?

I added that mod to my HQ-170 and it tremendously reduced its warmup drift.

After doing that, my only real quarrel with my HQ-170 was I felt that it had a rather high internal noise level while using narrow bandwidths with weak signal CW. It was annoying since I work CW about 75% of the time.

I ended up selling it for a good price about three years after I bought it. I replaced it with an RME 6900 receiver.
Now THAT was a great receiver for a vacuum tube boat anchor!

Randy,
I used one from about 1963 to 1975.

At one point I had a strange problem.
It turned out that the voltage regulator was no longer regulating
properly. I changed the tube and it was amazing.

One problem with the 170 family is that the WARC bands were
not covered. The 180 can be used on all bands and has the HC-10/SPC-10
guts built in.

I found my 170 to be quite stable after about 1/2 hour of being on.
Best Luck!

328. DX-100B Restoration Questions

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-01-24 23:40:38 UTC
From: WB8VCM <BMS5819@indy.rr.com>
Message-ID: <45b7ee77$0$28156$4c368faf@roadrunner.com>
Source record: 9272

I am the new owner of a DX-100B. I have no history on the radio, so I am carefully trying to examine it by comparison with the manual before applying any power. So far so good, no major items missing, but a couple items stand out.

First, someone has applied red tape under the entire outline of the modulation transformer (part 51-22). It does not appear to be a good enough job to electrically isolate the transformer from the chassis. Could this be to mechanically isolate the transformer from the chassis and limit audio-induced vibration?

Second, under the chassis near the modulation transformer, my rig has a big cylindrical component resembling a modern electrolytic. It's about 1 3/4" in length by 1" diameter. It has a "C-D" logo on it, with a part number CP28AIEH203K. From the schematic, it should be an 0.02 uf @ 1600V across the transformer secondary, but the size of the component is huge, at least compared to a modern component with these ratings. There is also an 0.001 uf at 3 KV disc ceramic tacked on in parallel with the big capacitor. Is anyone familiar with this big capacitor ?

Thanks,

Bruce

"C-D" could certainly be well-known capacitor manufacturer Cornell-Dubilier

It's a high voltage capacitor, with relatively high (for the voltage
rating) capacitance. It's likely oil-filled. It's fifty years old,
and they've learned a lot since then about making capacitors. (I
have a 10,000uF 16V capacitor I got about 1973 at a hamfest, and it
was big time then. It's also the size of a Coke can. The same
value electrolytic is now far smaller, and it's easy to get them
with a higher voltage rating.)

For the S-38 its 0, I don't know for the other but
Hallicrafters usually set the bandspread at 0 while other
makers used 100.

There are instruction books for the various S-38 versions
on the web. I think BAMA has at least one.

I can't help you with those caps but do have a question.

I just picked up a DX100B.
I've got a schematic for the "A" version but not the "B".

Do you have the schematic.
If so, would you be willing to pass along a copy?

I've not been able to find the "B" version schematic online.

tnx,

Doug/WA1TUT

Is the CD component across the secondary? I would unsolder one side of it and determine what the value is. If it is across the secondayr, it is likely an oil filled high voltage cap.

The tape is likely to prevent a mechanical resonance. However, examine it carefully. If the screws are insulated, it could be to correct a short to case, which could make the case hot.

There is a lot of information on DX-100 rigs on the internet. They sounded good before people started converting them. Electrolytics may need replacement, but it shouldc be a smooth operation to put back on the air.

Isn't that the one that used subminiature tubes? The one I'm thinking of
was pretty fancy, I never saw one up close, but I thought it did. And while
getting tubes doesn't seem to be a problem, subminiatures might be given
they never saw the same useage even in the old days.

338. MI5 Persecution: Toronto Freenet supports free speech (463)

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-01-25 19:39:40 UTC
From: MI5Victim@mi5.gov.uk
Message-ID: <m07002520340224@4ax.com>
Source record: 9282
Cross-posted to: alt.games.the-sims,rec.radio.amateur.boatanchors,esp.charla.religion,fr.soc.religion,chile.soc.religion

Despite an orchestrated campaign of attempted censorship by UK-resident newsgroup readers, TFN did not bow
to demands for a suppression of freedom of speech. TFN general policy on the matter is as follows;

Draft Policy on Account Deactivations due to News Group Postings
==========

News group postings occasionally take the form of a message which goes against the "topic" of the conference.
For example, a derogatory message about Canadians in the soc.culture.canada.

Members of such news groups then may send a message to the system administrators asking that a user's account
be terminated because of such posting.

The Toronto Free-Net Board of Directors has taken the position that the only postings that will get a person's
account terminated is material that is illegal under Canadian law. Otherwise, the Toronto Free-Net will not
take any action.

Freenet Executive Director Mike Anderson had this to say regarding the continued attempts of a minority of usenet
participants to have my account on his system deactivated;

The TFN's policy is not to take action against members unless they contravene the Criminal Code of Canada, or
engage in practices such as forgery, attacks against other computer systems or mailbombing.

Mr. Corley, while possibly being very annoying, has not contravened the TFN's policies. The TFN believes strongly
in freedom of expression, while recognizing that the price for such freedom may be a high signal-to-noise ratio in Usenet.

If Mr. Corley breaks the law, we will take action -- until then, he has the same rights as any TFN member to post
to Usenet newsgroups. Actions such as mailbombing the TFN in protest will be met by strong complaints to the
originating site's postmaster. The best defense against unwanted postings may be simply be to ignore them and deny
the poster an audience.

TFN Executive Director Toronto, Ont CANADA

Personally, I find it gratifying that my contributions to usenet discussion are recognized as being conducive
to a high signal-to-noise ratio by their quality and thoughtfulness.

Subject: BBC's Hidden Shame

Remember the two-way televisions in George Orwell's 1984?
The ones which watched you back? Which you could never get
rid of, only the sound could be turned down?

Well the country which brought Orwell into the world has
made his nightmare follow into the world after him.
Since 1990 the British have been waging war against one of
their own citizens using surveillance to invade privacy
and a campaign of abuse in the transmitted media in
their efforts to humiliate their "victim".

And the most remarkable thing about it is that what they
do is not even illegal - the UK has no laws to protect
the privacy of its citizens, nor does it proscribe
harassment or abuse except in the case of racial abuse.

A lot of people in England know this to be going on,
yet so far they have maintained perfect "omerta";
not a sound, not a squeak has escaped into the English
press, and for all the covert harassment absolutely
nothing has come out into the public domain.

Have the British gone mad? I think we should be told.

From: "Mr.B" <dgb01@stir.ac.uk>
Newsgroups: alt.conspiracy
Subject: Re: BBC's Hidden Shame
Date: Mon May 8 05:32:13 1995

Mmmm.

Who, exactly is this victim you're talking about?

First up, Britain or the UK (not 'England' - England is
a part of Britain, like Kansas is a part of the USA) does
have laws that protect the individual from harassement -
you can't just threaten people willy nilly. There are laws
against that. And if someone lies about you in the press
or tv then you have recourse to libel/slander etc. laws.

True, Britain has no 'privacy' laws as such, but isn't that
a good thing? As of this moment, the govt. are considering
a privacy law, but it is unlikely to succeed. Why? Because any
such law would benefit the priviledged and those in power.
Privacy laws, while supposedly protecting the individual, help
those in power hide their mistakes/scandals. They stop the press
etc. investigating. Privacy laws are undemocratic - they prevent
the people from keeping an eye on govt.

And stop looking for some kinda conspiracy in the British
press. It's hardly perfect, but your notion that they don't
cover/campaign against press legislation, harrassment,
discrimination, human rights etc. is plain wrong. You've never
seen a British paper in yr life.

You clearly have a specific case/individual in mind. Speak up!
The thought police aren't coming round just yet.

Douglas.

Date: Mon May 8 19:21:28 1995
Newsgroups: alt.conspiracy
Subject: Re: BBC's Hidden Shame

Confession time - the victim is/was me (except my name isn't
Corley, but that's irrelevant). What happened was not threats;
just invasion of privacy, in a partiicularly flagrant and
shocking way, in a way which most people would consider to
constitute harassment.

You know there's a particular category of person with mental
illness to whom TV and radio "talk", ie they feel the broadcast
is directed at them in particular? This happpened to me,
quite some time ago in the UK (I'm originally from London,
so I've seen plenty of British media print and other).
They invaded my home with their bugs, they repeated what I
was saying in the privacy of my home, and they laughed that it
was "so funny", that I was impotent and could not even communicate
what was going on. Who did this? Our friends on BBC television,
our friends in ITN, last but not least our friends in Capital
Radio in London and on Radio 1.

How did they do this? I'll give you an example. About a year ago,
I was listening to Chris Tarrant (Capital Radio DJ among other
pursuits) on his radio morning show, when he said, talking about
someone he didn't identify, "you know this bloke? he says we're
trying to kill him. We should be done for attempted manslaughter"
which mirrored something I had said a day or two before
(I'm not paranoid, honest!). Now that got broadcast to the whole
of London - if any recordings are kept of the shows then it'll be
there.

You mean the category where they think that everyone is after them ? that
one ? So lets get this straight you know you are paranoid and you think
that they are out to get you ? Uh huh, try putting the two together and
see what you come up with.

>quite some time ago in the UK (I'm originally from London
>so I've seen plenty of British media print and other).

>Radio in London and on Radio 1.

Oh yeah, I can see it now. All of them banding together, in a united effort against one man. So ITN, the BBC, and Capital all decide to sit round the table and they come up with idea of breaking into someones house, putting bugs everywhere, listening in to his conversation, and shoving it out on the news everyday. This someone has nothing to do with politics, or business, or entertainment, just an ordinary Joe Bloggs who seems to be extremely paranoid.

Have some sense, grow up and smell reality. What you are talking about would take loads of planning, tens of thousands of pounds and lots of people involved in the planning, execution and maintenance of it. You must have a very high opinion of yourself to think you are worth it.

>How did they do this? I'll give you an example. About a year ago,
>I was listening to Chris Tarrant (Capital Radio DJ among other

>(I'm not paranoid, honest!). Now that got broadcast to the whole
>of London - if any recordings are kept of the shows then it'll be
>there.

Of course you are not paranoid, just slightly mad. Did you ever look for the bugs in your house ? If not, why not ? I mean if I thought that was happening to me, I'd search the place from top to bottom, I mean I live there I would know if anything was out of place. If I was really paranoid, whoops I mean suspicious, I would call in one of those bug detection teams which have those machines that pick up the transmitted radio waves. This reminds me of BUGS, that new programme on BBC1 on saturdays which is all about this kind of stuff, but, shown as a drama / thriller. I suppose thats based on you as well is it ?

>is that there is a conspiracy in Britain, that it encompasses the
>broadcast media, and there is no way of breaking the conspiracy.
>The people who are involved in it will not open up.

What a load of jolly hollyhocks, I would say something else but, apparently students are not allowed to swear on newsgroups in case it damages the reputation of the university or some such jolly hollyhocks.

This guy is extremely paranoid to suggest that the entire British media is after him in such a big way. He gives no real reason as to why they are after him, just that he suffers/suffered from a slight mental disorder, could it be paranoia perhaps ?? No surely not.

I put it to the house that he has never recovered from this mental disorder, lets come out with it and call it paranoia, and thinks everyone is after him. Remember just because you aren't paranoid, doesn't mean they aren't after you.

This guy has a serious problem to suggest that the media would go to such lengths just to single out and ridicule one person. I mean apart from anything else, we (the listening masses) wouldn't be interested unless it concerned the royal family, politicians or showbiz personalities. e.g. the camillagate tapes. I would think that almost everyone, no matter how much they went on about infringements of privacy read the transcripts with interest. I really don't think that Joe Bloggs ordinary guy or paranoid nutter would have the same appeal. Well actually I dunno. :)

Regards,

Paul.

That is what happens in big cities. Hell, it scared me to death when I first started working in Manchester. People keep talking to me on the streets, even if its just to say hello, and I've no idea who they are. This happens to most people, don't worry about it.

>>paranoid, whoops I mean suspicious, I would call in one of those bug
>>detection teams which have those machines that pick up the transmitted

>That's exactly what we did. We went to a competent, professional detective
>agency in London, paid them over 400 quid to debug our house. They found
>nothing.

Doesn't this suggest to you that there are, in fact, no bugs to be found?

>Over Easter I went to the police in London, telling them basically
>what I've posted here. I don't think you'll be surprised to learn
>that I didn't get very far; they asked "why would they be doing this to
>you in particular?" and the answer "they are because they are" doesn't
>go very far.

Exactly. All you have offered so far as proof of your harrassment by these people is:

1) Someone on radio said something that you had recently said
and
2) People on the streets seem to recognise you.

These are both perfectly normal occurences and happen to lots of people every day so it is unsurprising that people here, and the police, are not taking you seriously.

Trying to always keep an open mind about things I would say that one of three things is likely.

Either there is a lot more to this that you are not telling us, or you are messing about or you have some genuine delusions. I'd like to think that in

two of the three cases you would find some real support here, but it seems unlikely I'm afraid.

Claire

Subject: Re: BBC's Hidden Shame

>That is what happens in big cities. Hell, it scared me to death when I first
>started working in Manchester. People keep talking to me on the streets,
>even if its just to say hello, and I've no idea who they are. This happens
>to most people, don't worry about it.

The key is the pattern, or a change in the pattern. I've lived in London almost all my life, and just walking around the streets, I never got hassled by anybody. All of a sudden, people start harassing you, throwing abuse at you, behaving as if they know you personally, as if they've seen you before somewhere. I read in the papers that this happens to Colin Stagg and people like that Eastenders actress, but they've had their picture in the paperes, so that is understandable. In a couple of cases people have even known my name - when I was in London over Easter I was walking down Shaftesbury avenue in the West End when somebody (no idea who they were, just some bloke with his girlfriend) called me by name - quite clearly, and my name is distinctive. This also happened once about four 1/2 years ago, onn the tube - some blokes I had never seen started chanting my name and a term of abuse.

It's the pattern which convinces me there's something to it - and would convince any impartial abserver who could see things tyhrough my eyes.

>Doesn't this suggest to you that there are, in fact, no bugs to be found?

There's a little story behjjind this. First iof all, in 1992 I worked for a company where the people made clear they knew what was going on, first of all directly (the very first evening I was there I went out to the pub with them and the Technical Directpor said to another guy, "is this the bloke who's been on TV?" "yeah, I think so") and also indirectly, by rep[peating stuff I was saying at home in London and in my rented accomodation there (I moved several times in the course of 1992 and they followed me each time). Now, if "they" (the buggers) knew their bugs could be found easily, they wouldn;'t be keen to make

their existence known, would they?

Also, in summer 1992 I went on a trip abroad to Europe by coach, and
on the way out there were a couple a little younger than myself on the coach
a bloke and hius girlfriend. He said things about some bloke who was
never named, who sounded exactly like me - and he made explicitly
clear that our house was bugged, and that a neighrbours house was
bugged (and at work they'd been rep[earting what was said at the
neighbours, so this looks like independent corroboration).
They also said stuff like "at school he was always really streesed,
they found someone from his school and he was a real psycho"
and that "he was in a B&B for one night and they got him", dead right
again, I had been in B&B for once night a few days before this trip
and weatching the news again got a reaction from the newsreader.

Subject: Re: BBC's Hidden Shame

>:some pirate radio station in London in 1991, started listening to
>
>Conclusive proof if ever I heard it.
>
>Of course you were the only person in the office in the whole of Britain

Yeah, but this is the point. Each incident is easily and automatically
deniable along the lines you're taking. But when this happens every
time, and when you get independent corroboration from other people,
then there's no escaping it. For example, immediately after I lost
my job in 91 I went into the local garage to get some work done on the
car, and one of the blokes there said to the other, "so what do you
think of it then? it's getting killed on the radio isn't it"
Now again, you look at that and no proff; you can ask them what they're
referring to and they can say they're talking about something else.

>I know you may be a little paranoid, but I suggest you sit down
>and work out rationally what possible reason anyone off television,
>or radio would have for listening to your conversations. After all
>it must be hard enough to present a show to millions of people
>without the added burden of watching and listening to a single
>person and slipping their phrases into the programme.

These presenters are clever people. They wouldn't be presenters
if they weren't - they're easily capable of reacting to an individual
in this way.

What possible reason? I guess because they think it's amusing to do
so. They know that if you ever tell anybody, without being able to
show any evidence, then the reaction you'll get from just about
anybody will be the one you're showing now.

I realize there are loads of people in England and elsewhere with
the sort of thoughts I've described in these postings; and almost
all impartial observers would say that nothing other than an
go after their private conversations (if they did it to me then I can
do it to them, it's a questions of technical competence and money).
If you were lucky, you might be able to entrap them into admission.
You could of course harass or threaten them back (any coppers reading
this?) but that would be illegal and might get a result quite
different to the one you're trying to achieve. Of course, it might

come out of its own accord given time - if so many people know, if
they have an escape valve in their "subtext" through the media,
will it not cease to be at a covert level, given time? Surely it
is in my interest for it to become overt, since the transgressions
at this time are on their side and not on mine?

Thoughts? There must be some way of breaking the secrecy. This
isn't the first time in human history that a conspiracy has taken
place on this scale, but the truth tends to out. The situation
now is they think they';re "winning" hence have little stimulus
to change the rules - if they started seeing themselves "losing"
things could change drastically.

Mike, if that is your name,

I'm going to try to rationalise what you're telling us. I can think of three
possible explanations for what you are experiencing.

One is that there _is_ a conspiracy against you. As a previous writer said,
though, a lot of these programmes are taped, so it really isn't possible in
some of the cases you've named. Further, why were no bugs found in your
house? Finally, unless you are a political figure or someone else in the
public eye, why would anyone bother? People like me (and I assume you) are
small fry; our contribution to society is likely to be minor. Why would
anyone spend so much money and effort on you?

Another possibility is that you are developing some kind of paranoia. There's
no stigma attached to this; we're all paranoid to some extent, although
perhaps not to the extent that a doctor would call us paranoid. I think
paranoia is quite a straightforward explanation here - you really do believe
that all these things are aimed at you; you see people everywhere trying to
get at you. Logic suggests that this cannot really be the case.

The third possibility is that not even you really believe any of this, and
that this is a "troll". I'm not sure I believe this possibility, but it's
possible.

Anyway, if you want to be sure that you're _not_ going mad, I'd go and see
your G.P. if I were you. If you don't trust him/her, why not see someone

recommended by a person you can trust? If you don't trust anyone any more, don't you think it's time you got help?

For a troll, the posts are remarkably well-informed on paranoid behaviour.. you'd need to be one, or be reasonably well-informed on the subject to sustain the tale... which lead me to my theory...*ahem*...:

An extension to possibility 3 (Number 3.5, perhaps?) is that the original poster may be somehting like a psychology student writing a term paper on the net community's reactions to this tale. (Now, there's paranoia for you! Not only are they listening to/watching us, they're writing reports about us too...:-)

More likely, though, is that the poster is genuinely in need of professional help (he has intimated as much, himself) and, as such, he should be encouraged to seek it.

>reply? Something more constructive than those silly little
>jokes about paranoia perhaps? Like what objectively can you do
>to break the conspiracy open, if one exists :-) ? If somebody
>did it to you, what would you do?

But we've *done* that. I certainly have at least. Way back when you
originally started posting and your posts were neither tediously repetitve
nor stupidly long.

But whenever anyone makes any good suggestions you ignore them and start
posting from the begining again. You don't want us to help you - so what do
you want? If you really wanted help you would listen to peoples suggestions
and respond to them. Is this just an attention thing?
But I'll try again, because I'm a fool like that.

>o Tell people about it, go to the police / legal services
> Done that; those around me either don't believe me, or they
>"sort of" believe but can't do anything about it. As for going
>to the police; I did, over Easter. Discouraging. They must be
>familiar with the occasional person walking into a station with
>this sort of story. "If a psychiatrist says you're imagining
>it, then that's what it is".

You haven't yet given any examples of anything concrete to suggest that this
is really happening to you. This, I would imagine, will be the stumbling
block for the police. How can they possibly help you when your only evidence
is a jumbled mess of TV presenters saying things that could be construed as
answers to your comments and the 'feeling' that people are talking about you
and watching you?

I seem to recall that last time this was being discussed someone asked if you
had been to see a psychiatrist about this - after all if this is really
happening then you have can only benefit from being given a clean bill of
health. I don't recall an answer.

> I also went to a firm of solicitors; again, very
>discouraging. Put bluntly, they can't deal with cases where the
>perpetrators aren't well-defined and the existence of the crime
>itself is unprovable.

Well how could they? Who would you sue? The country?

>o so if that option is out, what's left? well, there's the
>"do nothing" option. To some extent this option works. They've
>spent a lot of money and ultimately achieved nothing except to
>force me out of the country - which has been an own goal for
>them, since now they can't do what they were doing in the UK.
>Expenditure of further resources would feed the pockets of
>their greedy contractors, but is a waste of money as far as the
>employing organization is concerned.

So you are no longer in the uk? And this is not happening anymore?

Then let it go. Just leave it alone and get on with your life. Its just not worth it. There is nothing you can do to prove that this happened whether it did or did not. So forget it. Go and explore the net - when people aren't spamming it with useless repetitve posts there's a lot of interesting and worthwhile things out there to see and do. Likewise real life (I'm told *&).

>completely conventional, I have a good academic and work
>record. Until all this started, I had no mental health
>problems; the diagnosis of illness was only after 2 1/2 years
>of abuse. If they did this to me, they could do this to
>absolutely any British citizen. If this stuff gets out, it
>won't be me that has to worry - it'll be them. They take a
>normal person, lie about him, demonise him, try to force him
>into killing himself - and this is in a country where the rule
>of law applies?

If this gets out then *that* will be the time to bring your claims to the foreground.

The only thing ruining your life right now is you, Mike. And the only thing that will make your life any better now is also you. So go and make your life better and show them that they failed.

Claire

==========

>But we've *done* that. I certainly have at least. Way back when you
>originally started posting and your posts were neither tediously repetitve
>nor stupidly long.

Once again we're running into a brick wall. The reason I started posting was because I couldn't figure out a way out of the situation, and thought that saying it out into the open would provide a catalyst for one of those "in the know" (there are plenty in this category, and it's a fair

bet that some of them are reading this) to speak up.

It hasn't worked, yet. A little more aggressive shit-stirring (excuse expletive) might do the trick. Perhaps Usenet posting is the wrong arena for this sort of activity; although obviously it does have the advantage of rapid feedback.

Thing is, for people to open up, you would have to provide them with a reason why it would be in their interest to do so. There's no obvious way of doing that; to get thinking people to incriminate themselves when they're safe in denying all knowledge is not a trick I can figure out how to do.

>But whenever anyone makes any good suggestions you ignore them and start
>posting from the begining again. You don't want us to help you - so what do
>you want? If you really wanted help you would listen to peoples suggestions
>and respond to them. Is this just an attention thing?
>But I'll try again, because I'm a fool like that.

A "good" suggestion would be one which had the effect of halting the persecution, which so far hasn't happened. If you make a "good" suggestion then damn right I'll stop posting - because then I won't have to.

>You haven't yet given any examples of anything concrete to suggest that this
>is really happening to you. This, I would imagine, will be the stumbling
>block for the police. How can they possibly help you when your only evidence
>is a jumbled mess of TV presenters saying things that could be construed as
>answers to your comments and the 'feeling' that people are talking about you
>and watching you?

Because, as said previously, concrete proof does not exist. If it existed then I wouldn't be talking to you - if it could be proved, or if those doing it could be found, they wouldn't be able to continue.

What's happened is all conversation. You can't prove conversation, not without a tape recorder, and even then you would have to prove that what they meant corresponded to what you understood.

The psychopath who manages the Applics group at my previous employers played little word games, not only with me but with at least one other person in the group; words which rhyme with swear words, words which are ambiguous, eg "bent", words which rhyme with wank, "sheet" rhymes with shit, end (how was your weak end? being the standard salutation on a Monday morning). Sounds childish, most people would easily tell him to fuck off; except to people with predisposition to depression and the inability to express themselves (this was before I started taking medication), that sort of nastiness is not bearable. After ten months of this I was so ill I was crying constantly, eventually I went into hospital and started on medication. Somebody else he did this to (over a year later!) got so depressed he took an overdose of pills, had to go on antidepressants and left.

And where does the "concrete proof" of this trouble exist? NOWHERE. Even if you had physical evidence, even if you had the presence of mind to record what was said, how could you prove what he actually meant by what he was saying? In some cases of harassment you can prove what was done,

because it's undeniable. But when the harassment is done with any presence of mind whatsoever, it becomes difficult. In the case of the wider harassment, the people doing it obviously know what they're about - they must have done similar things to other people before in one form or another, and they know what they can get away with, they know what the police will do nothing about.

>I seem to recall that last time this was being discussed someone asked if you
>had been to see a psychiatrist about this - after all if this is really
>happening then you have can only benefit from being given a clean bill of
>health. I don't recall an answer.

Yes. The reply was of the "neither confirm nor deny" variety. Not much else they can say, is there?

>Well how could they? Who would you sue? The country?

Hmmm, now there's a thought... :-)

>If this gets out then *that* will be the time to bring your claims to the
>foreground.

Wrong way round. It won't get out unless I do something to bring that about; remember, it isn't in THEIR interest for THEIR criminality to be exposed. Yelling loudly on Usenet might nudge things along in the right direction.

>The only thing ruining your life right now is you, Mike. And the only thing
>that will make your life any better now is also you. So go and make your
>life better and show them that they failed.

Ignoring them would be bliss, but it's not a winning strategy.

There are going to be more of these posts. Sorry. That's the way it is.

>Very unstructured, no proof whatsoever. So why should anyone
>take it seriously? If I said to you, "my next door neighbour eats
>babies", how much credibility would you attach to that?

Well, cos it's true. I was hoping that someone "in the know" would
appear and make some self-revealing comments, but that hasn't
happened. Everyone's keeping quiet. What a pity.

>>This is an agglomeration of articles and replies previously
>>posted to Usenet, so it's a bit hard to read. This posting
>>describes a campaign of character assassination initiated

>Who's character is being assassinated? It isn't clear from the post.
>Are we talking about Grenville Janner? I thought he was a spook
>himself? He's certainly able to hold his own on the issue you cite.

Mine, mainly. The reason for putting that episode at the top
of the posting is that they tried to kill two birds with one stone
at the Beck trial - they simultaneously put words into the mouth
of their invented "witness" to smear Janner, and repeated exactly,
word-for-word, stuff which had been said by and about me.

That was the only occasion (the only one recognizable to me,
anyway) when they went after another target at the same time.
And it's quite lucky they did that - because it could give some
pointers to who they might be.

Presumably there are people still around who were involved in
that trial, and know what happened. Beck might be dead, but the
"witness" would still be around, as would Beck's solicitor.

>>by a group of people or agency within the UK. Although
>>they have never presented their identity, you can draw
>>your own conclusions on that point. There aren't many
>>people with the technical resources and contacts in
>>society to make feasible the sort of deliberate attack
>>on an individual which is described in this article.

>>to be a victim of Beck's"; but, it wasn't Beck who set up the
>>attempted character assassination on Janner; the fact that they
>>took a side-swipe with their verbatim repetition shows
>>where the real source is to be found.
>
>The newspapers?

Well, your guess is as good as mine. But what newspaper would
send a team after someone for five years? I don't think so,
somehow. Of course they could, but it wouldn't be in their
commercial interest.

You'd have to look at a corporate entity which would indulge in
activity of this type, and the nature of the contacts they have
narrows down the search.

>>The goons behind the molestation are lower than the paedophiles
>>they use to convey their propaganda - they use the same
>>strategy of covert abuse, but there is nobody to check their
>>actions, or to bring these criminals to justice.
>
>Ummm.. Janner is a Barrister, a journalist who writes on a wide
>variety of issues, and a long-standing Labour MP. If he's unjustly
>smeared, he's more that capable of setting the record straight.

Janner blamed Beck for the invention. He didn't say anything about
it having any other origin. Even had he suspected any other source,
he could hardly have pointed the finger without some evidence.

>You say that the media is making similar allegations about you in
>relation to this issue? So, you're accused of child abuse, amd
>the allegation was reported in the media, I assume.

I've been accused of many things although that wasn't one of them.
Most of them have been yelled in my face by people on the street
in London at some time or other. Bit difficult to misinterpret
when that happens.

>What exact;y are they saying about you? (Respond here please. I'm
>leaving the UK tomorrow, so I can't read e-mail.)

It changes with time. Every so often, they sing a new song;
so at one point the allegation was homosexuality, at another
is was low intelligence, then it degenerated into sexual abuse.

<snip>

>>They invaded my home with their bugs, they repeated what I
>>was saying in the privacy of my home, and they laughed that it
>>was "so funny", that I was impotent and could not even communicate
>>what was going on. Who did this? Our friends on BBC television,
>>our friends in ITN, last but not least our friends in Capital
>>Radio in London and on Radio 1.
>
>How do you know this? Just from what you hear on the radio?

I can't remember if this was mentioned in the "regular" posting,
but on a few occasions they set me up with people nearby to talk
about me, or more correctly, to talk about somebody who
(in their minds) "resembles" me, with actually naming me.

One such occasion was a coach trip to Europe in June 1992.
The "set up" comprised a guy talking to a vacant giggling female
about "this bloke", who was never named. Apparently "they"
(also never named) "found somebody from his school",
"they" "got" him at his house and at a neighbours, and at
a B&B where their target was for one night.

Apart from that, yeah, from "what I hear on the radio". And
from what I see on TV. (I wouldn't be doing my job as a
mentally ill person properly if the TV and radio weren't
talking to me, now, would I?)

>>Oh yeah, I can see it now. All of them banding together, in a united
>>effort against one man. So ITN, the BBC, and Capital all decide to sit
>>round the table and they come up with idea of breaking into someones
>>house, putting bugs everywhere, listening in to his conversation, and
>>shoving it out on the news everyday.
>
>But why would they do this? What possible reason would they have?

But why get at anybody? Victimisation is the pastime practised against
other people; as the scorpion said to the frog, "it's in my nature".

>Are you aware that what you describe is also a common symptom of people
>who are suffering from a psychiatric illness? Have you been to your
>doctor and told him about this? Did he prescribe any medication? Have
>you been taking it, or have you stopped?

Yes, Yes, and Yes respectively. Still taking it. Doing quite well actually.

>>This someone has nothing to do with
>>politics, or business, or entertainment, just an ordinary Joe Bloggs who
>>seems to be extremely paranoid.
>
>Usually a clinical symptom rather than proof of a conspiracy in such
>matters.

>>How did they do this? I'll give you an example. About a year ago,
>>I was listening to Chris Tarrant (Capital Radio DJ among other
>>pursuits) on his radio morning show, when he said, talking about

>>someone he didn't identify, "you know this bloke? he says we're
>>trying to kill him. We should be done for attempted manslaughter"
>>which mirrored something I had said a day or two before.
>>Now that got broadcast to the whole of London - if any recordings
>>are kept of the shows then it'll be there.
>
>And this is supposed to mean... what? Chris Tarrant is in on this plot
>to kill you? It sure sounds like a joke to me. When you start to get
>ill, the mind often makes connections that seem logical and lucid to
>you, but do not to the rest of the world. This is one of those connections.
>They are usually known as delusions.

This is the problem, and there doesn't seem to be any way around it.
If a clearly sane person reported this persecution, you might believe
him, but probably you'd tell him to go see a doctor to "verify his
sanity". If someone with the illness of which you could argue these
things to be symptomatic says these things, again, you might believe
him, but it would be unlikely - the easiest route is the one you are
taking in the above paragraph. The only way I can convince you of what
I am saying is by giving precise details of what, when, how - and for
most of that stuff is based solely on memory.

To prove it would require an admission from somebody, or else hard
proof in the shape of physical evidence such as tape recordings.
Of course, I don't have that.

>The idea of a "pattern", and the notion that if anyone could look
>through your eyes they would see the same thing is very indicative of
>the onset of a psychiatric illness. Schizophrenia and manic depression
>have similar symptoms. I'm not trying to be disrespectful here.
>This may be an illness and it can be managed by the use of medication.
>If it _isn't_ treated, it can lead to terrible tragic consequences.

I'm quite aware what the symptoms would be, and that the reality
corresponds to those symptoms.

But if anything, that is an argument which could convince you of
the truth of what I'm saying. If they deliberately set out to
simulate the symptoms of schizophrenia - in other words, if they
know through observation that their target is either suffering
from the illness, or is on the borderline and could be pushed in
with an appropriate stimulus, then they can feel safe in what
they do, since once you are registered as suffering from the
illness, people will assign less credibility to assertions that
persecution is based in reality.

That this can happen, and people collude by silence, is absolutely
horrifying. It is all the more horrifying that it can happen in a
country such as Britain which has no history of repression.
Perhaps its happening in the UK is due to the arrogant assumption
of moral superiority on the part of those in the media and others
involved - we won the last war and we can keep harping on about

German and Japanese war crimes, so we can do whatever we like and
we'll be right, up to and including destroying the lives of our
citizens (as long as we're not caught doing it).

>>That is the level it's at - basically they show they're listening
>>to what you're saying at home, they show they're listening to you
>>listening to them
>
>But why? And why you? Do you realize how much it would cost to keep

>So, all in all, you couldn't actually do the job for much less than
>a quarter million a year. Over five years. What are you doing that makes
>it worth the while of the state to spend over one and a quarter million
>on you?

Those are pretty much the sort of calculations that went through my
head once I stopped to consider what it must be costing them to
run this little operation.

The partial answer is, there have been periods when the intensity has
been greater, and times when little has happened. In fact, for much
of 1993 and the first half of 1994, very little happened. Although
I don't think that was for reasons of money - if they can tap into
the taxpayer they're not going to be short of resources, are they?

The more complete answer is in the enormity of what they're doing.
When countries kill their own people, as a rule, they get found
out and all hell breaks loose. This isn't some para shooting
Irish teenagers in the back. This is something which permeates
English society, which they are ALL responsible for, and which
they cannot escape responsibility for.

Relative to the cost to British pride of seeing their country
humiliated for the persecution of their own defenceless citizens,
isn't is worth the cost of four or five people to try to bring
things to a close in the manner they would wish? To the
government a million or two is quite honestly nothing - if they
can convince themselves of the necessity of what they're doing,
money is not going to be the limiting factor.

>>What possible reason? I guess because they think it's amusing to do
>>so.
>
>What? Spend a quarter mil. a year to amuse themselves? And why not
>change every now and again? Why keep watching you? (Unless you _are_

>try soc.support.depression and see what some of the people there have
>to say about this? Just to get some more perspective on your perspective,
>so to speak?

Sure, it "leans" towards it. But please at least admit there is a
POSSIBILITY of it being very real. And once you've done that, can
you come up with some thoughts on methods of proof? I may be missing something
in my assessment - there may be a way of proving it, in the face of non-
cooperation from the "players".

>Hmmm, strange eh.
>I mentioned all this goings on to my boyfriend, who works for the
>British intelligence service, and he assures me this sort of thing
>never goes on.. not ever...honest.
>Though he said the name was familiar...

it does go on, although it's an open question who does it.

Some time ago there were press reports of an Army intelligence person called Jones who claimed Diana and Hewitt had been photographed in a compromising position... he said he'd been doing this as part of an Army unit which had previously operated in Northern Ireland.

Then Hewitt said he'd been told the same thing by some Army people, and that they were threatening to release the tapes unless they curtailed their liaison... as per usual everyone denied everything, painted Jones as the "Jones twins" - not very original in how they deal with their perceived enemies, are they?

You have to wonder how they manage to achieve this sort of surveillance though. Audio you can understand, it's possible to put a microphone through the wall, and apparently there exist devices which will retrieve sound from a laser beam bounced off a window - sounds sci-fi, but there's a well known surveillance electronics company in London which sells these things.

But how would you get video out of a room, unless you had actual physical access in order to plant a device for pickup? We're not talking about looking in from afar, but an actual device within the room. You could either drill through the wall and shove a pickup through; or you could supply a trojan device with a hidden pickup inside; but most likely, you would have to physically break into your target room to plant a camera. That's not an infeasible option; all it means is having your target(s) watched to make sure they're not in the vicinity, then you negotiate any locks on the property and find a suitable receptacle for your device.

The next question is how they defeat the usual methods of counter-surveillance. We had private detectives carry out a "sweep" of every room and the telephone line. They found nothing. That indicates at least four possibilities that I can think of; (this is all guesswork BTW, and probably fanciful guesswork at that!)

1) no bugs (pull the other one)

2) radio-transmitting devices which can be controlled from an external source, ie you can instruct them to switch off when you detect a counter-surveillance sweep taking place

3) hard-wired devices; probe microphones or whatever they're called, things you poke through the wall

4) passive surveillance devices; so you bounce laser or radio waves off a suitable reflecting surface (again, sounds far-fetched but such things may apparently exist).

5) there is a fifth possibility, that the PI's didn't detect an actual transmitting device; there are technologies specifically designed to avoid detection, eg frequency hopping and suchlike. But how much sophistication could you build in to a device which would have to be small enough to be physically concealable?

I guess the real question is to find out who is ultimately behind these "goings on". And if the "great and good" (or the better known, at any rate) can't protect themselves, what hope is there for the rest of us?

> never did make sense.
>
Hi,

The audio feedback percentage is not dependent on the AVC voltage,
but on the setting of the audio gain pot. If you leave the audio
gain at a low setting, you get more negative feedback,
hence a smoother audio response. The feedback is via resistor
R80 (100 Ohms) at the audio output transformer secondary,
to R77 (47 Ohms) between the bottom of the 1 Meg audio gain pot
and ground.

My HQ-170 audio sounded a lot better with the cardboard back removed
from the matching Hammarlund speaker housing.

My HQ-170 responded very well to an alignment, although it is more
drifty than I like. I picked up a small filament transformer
for the VFO and mixer tube continuous filament voltage mod,
but haven't quite gotten around to installing it yet.
(Can it be 5 years, now?)

73,
Ed Knobloch

Here would be my things to check, and priority:

1. Does it turn on?
2. Can you hear stations with it?
3. Is the sensitivity up to where it should be, or low (weak tube(s)?)?
4. What is the calibration like on all bands?
5. Functionality of other stuff (AVC speed, slot filter, etc.)
6. Scratchiness/dirt in bandswitch, and pots.

I bought a HQ-170 at a hamfest several years ago and it wasn't in the best or worst of conditions. I heard stations but the S-meter needle never went up all that high. I actually used the receiver for many contacts. Yes, there is warm-up drift (maybe 10 kc on 75 meters). Also, I noticed that the receiver sensitivity actually got a little better after an hour's warmup. Also, the crystal calibrator never worked cold (also, worked fine after an hour warmup). Selectivity was better than on my Icom 707 and you could move the BFO freq to adjust the position of the steep sides of the IF passband to beat some close signals. However, my slot filter does not work. My 170 is 160 through 6 meters; I think maybe earlier ones were only 160 through 10 meters.

Overall, its not too bad. And, when I get done with some other higher priority work, I'm going to go through the tubes and check whether they are weak or OK.

Yes, I'm going towards "retro" myself. Ultimate goal is to build (with drill and soldering iron) a complete, total, homebrew tube station (AM and SSB) mainly for 75 and 160). I already have most of a total homebrew transmitter finished (including pair of 813s in GG). You can see some of this at: http://www.panix.com/~asd

Thanks Straydog and others...lots of very good advice. Hopefully the HQ-170 will arrive soon but I expect it early next week. I have printed out the manual and some of the other tech notes. Making a book with all this info. I enjoy listening to the Amers on 75 and 160 and hope to have my own vintage station setup eventually. This HQ-170 is my first item. After I get the HQ-170 going well, I will start looking for a transmitter. Thanks again and 73 de Randy, WB5KCM Fort Worth, Texas

Hi Colin,

Yes, it is across the secondary. Thank you to everyone who suggested it might be an oil filled capacitor. I'm going to replace it with something "modern" during my initial efforts to reach "stock" configuration.

I looked at the transformer and it is bolted in with metal hardware and no insulating washers. Hopefully it was taped up for mechanical resonance reasons, but I'll do some testing to make sure the case is not hot.

Thanks,

Bruce

Hello Mike:

That is a high voltage point, so be sure the voltage rating is high enough. I have plenty of boat anchors - many of which were more expensive than the DX-100 when new. But, over a period of time, I have come to appreciate how wonderful the DX-100 is. The Collins rigs are excellent - but they are harder to work on and do not cover 160 meters. The Johnson Viking series is nice - but does not have a vfo.

In short, the DX-100 is a very nice boat anchor.

It had about 65 tubes, came in two parts and was a horror to maintain.
There is absolutely no good reason to mention it in this thread, I am
afraid :-). The Navy did not like its performance either. It does
sometimes come up for sale, but not at any high price. Postage and
Packing problems means that it is not a typical ebay item.

No, they're not hijacked. It's just someone with his own agenda, and
possibly a need to get (back?) on medication for his problems.

Hi Chuck:

Well, that was from memory. You are right it is an audio feedback based upon the gain control. The Drake 2B had negative feedback audio and sounded better.

The last one I worked on, someone had run 100 watts into the antenna input and that required manufacturing new coils. The forms were ruined. It would not have been so bad, but when the radio quit, he switched bands to find out why - with the transmitter still on.

Source record: 9209

1/26/07: Well I got the HQ-170 in via UPS last night. Unpacked the box
and put it on the bench. Noticed several things bouncing around inside.
Removed the 3 case screws from the rear and pulled off the cover. What
was rattling around was about 3 tube shields. I replaced these and
straightened several tubes. Checked the fuse and it looks good. Made
several checks to make sure there was no shorts, all checked good.
Don't see any burned components.
I do see a couple interesting items:
1. The first IF transformer, T1 has had several things soldered to it.
Looks like it may have been replaced some time in the past.
2. The can transformer at the rear of the chassis near V13 has been
removed and it looks like an open type adjustable transformer has been
installed in its place. There is a coax cable connected to this
transformer that is connected to the vernier tuning cap.
Connected a speaker and antenna. Plugged it in and turned it on. Got
one dial lamp burning and all the tubes look to be lighting up. After a
short warmup period, I can hear some signals on 40 meters....very nice,
the SSB and AM signals sound good. Trying the other bands...I can hear
some...only a couple signals on 75 meters and nothing on 160. I can
hear static on 20 meters and the other higher frequency bands, I can
hear static but no signals. I can hear the calibrator on these bands.
Looking at the overall physical condition of the receiver it has all
the knobs, including the clock knobs. The plastic lens on the clock is
cracked. The cabinet has a few paint abrasions, a couple dents. Needs
cleaning inside and out.
Looks like I have a good project here. Hope to get started on it this
weekend. Appreciate all the comments and hints on the restoration. If
you see something I need to look for from my description please pass it
on to me.
Thanks and best 73 de Randy, wb5kcm

Hi,

The TU-26-B is actually just a tuning unit for the old wartime BC-375 aircraft transmitter, covering the low frequency aircraft band. If it's unmodified then it won't work as a transmitter - but TU series units were often used as the basis for home-built transmitters and that is what you might have. The unmodified TU-26-B won't have any power leads or tubes, it will consist of switches, variable capacitors and large coils. A photo might help :-))

Can't help with the Pan-Am 85B.

There's a good mailing list for boatanchor radios on http://mailman.qth.net/mailman/listinfo/boatanchors Might help if you're just starting out in this area of ham radio.

Regards,

Roger Basford/G3VKM

You do get your hands dirty. That's a lot of homebrew. What I find admirable is that you just go ahead and DO it without obsessing over a perfect front panel and such. I can't begin to count the number of projects I've thought about taking on but never did because my workshop skills are so-so and I knew I couldn't make the finished products look the way they did in the Handbook, so why bother? It's a dumb attitude, but I'll bet it's shared by a fair number of hams. I did build some things, but nothing ambitious. You have my respect.

The rectifier diodes and capacitors will probably need replacement. The large, axial lead caps used in this, and other amplifiers, are getting harder to find. I currently use infinitely less expensive "snap in" capacitors of the required value. For diodes, I use 1N5408, rated at 1000v/3A. The snaps require some creative wiring, but they will fit in, OK.

378. Fake tubes?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-01-27 22:21:13 UTC
From: Antonio Vernucci <vernucci@tin.it>
Message-ID: <45bbd058$0$15087$4fafbaef@reader3.news.tin.it>
Source record: 9222

Having got an old Zenith battery-receiver with no tubes, a friend of mine bought two new tube sets including the expensive and hard-to-find 1L6 converter. The receiver works, but is fairly weak.

While checking the receiver, I determined that the 1L6 filament voltage is nearly twice than it should be (about 2.6V against 1.4V, very dangerous!), whilst the filaments of all other tubes are at nominal (1.4V). This is odd, as tubes are all in series. Trying the spare 1L6 gave the same result.

I thoroughly rechecked the circuit, finding nothing abnormal. I then removed the 1L6 and replaced it with a resistor having the same value of a hot 1L6 filament (27 ohm). Surprisingly, the voltage across the resistor was now correct (1.4V).

So I built a little test jig, connecting the 1L6 directly to a 1.4V source and measuring its filament current. Instead of reading the 50mA, the current only was about 25mA, just half of what it should be. The spare 1L6 gave exactly the same result. I also checked my test jig with a different tube (1U4), getting the normal 50mA value. So I was sure that the 1L6s have a problem.

Being aware that there are two different series of battery tubes, i.e. the 50mA series and the 25 mA series, I checked my tube catalog to determine whether a 25mA tube exists that could be pin-to-pin equivalent to the 1L6. I found it: the 1AB6.

Having read on the internet that selling fake rare tubes is getting a common practice, I would tend to conclude that the dealer sold my friend 1AB6s remarked as 1L6s (they are branded "DEC 1L6" in white).

I wonder whether any of you had the same experience or heard something similar.

By the way I tried to cure the problem by putting a 56-ohm resistor in parallel to the (fake) 1L6 filament. Voltage then dropped down to the normal value, but the tube quits oscillating. As the 25 mA series tubes have a lower plate current that the 50mA tubes, my conclusion would be that the circuit parameters are unsuitable for a 25 mA-series tube. Nevertheless when the filament is largely overheated the 25 ma-series tube anyway succeeds to oscillate.

Tony, I can't speak for the kinds of tubes you related, here, but I can relate that I purchased a $30k consignment of hydrogen thyratron tubes to be used in US weather radar systems. The only manufacturer, at the time, was English Electric Valve. We got the shipment and had a 100% rejection rate. The supplier (a noted commercial NY tube vendor) had re-marked and re-branded some horrible Soviet old-style thyratrons. I'm sure the practice is done at all levels.

To Whom It May Concern:

Just so you have a complete picture of Paul W. Schleck, I took the following from one of his posts in news.groups.proposals:

"Mark Morgan, KB9RQZ, is correct that all of our proposed moderators and consultants hold the highest class of Amateur Radio Service license in their countries (Amateur Extra for the U.S. team members, Class A or similar in the case of Jack Cook, who holds both UK and Australian licenses). However, that doesn't mean that we would be judgemental or unfair to other classes of license. We would certainly be open to adding moderators to our team that hold other classes of license. We will certainly decline articles that are disrespectful to or prejudicial against other participants for any reason, including license class. We would prefer to judge ideas, and take posts at face value, rather than prejudge individuals and credentials in a vacuum."

Now that just speaks volumes about this man, his caliber, his "ethical standards", etc. Now, doesn't it?

Gawd! I feel sick ...

Warmest regards,
JS

Unbelievable, is there ANYONE here who believes Mr. Schlock... err, Mr. Schleck would be "fair" and just to ALL? That he would consider ANYTHING other than his own petty gripes and bitches? If so, step right up here to defend the man, I am waiting ...

My gawd, the man is so crooked he makes my dogs hind legs look straight!

Regards,
JS

Schleck is all about self-aggrandizement. His posts are all about himself.
Read his posts, the few that he sends. Paul is convinced that he, and only
he, has true insight into Ham matters and that he, Paul Schleck, knows
better than us, the Great Unwashed.
Does the term, "Stuffed Shirt" come to mind?

Wodger:

ABSOLUTELY! And, he is much, much more. That bit of his just took the
GREATEST LIAR I have ever known and made that liar look like nothing ...

Schleck is good alright, the man has brass b*lls the size of
basketballs, and his little trolling bunch of henchmen are
sickening--strange they ALL seem to have extra licenses, isn't it?

Course, he just "swore" to the committee that they would not be "unfair"
or "judgmental", what a GREAT FARCE!

Warmest regards,
JS

Tony,
Could I suggest you post this experience on rec.antiques.radio+phono ?
It could be an important heads-up for the many who own/repair/restore
Zenith TO models, among others.
Cheers,
Nelson

Here is what my response to Mr. Schleck would be on his proposed moderated newsgroup:

Mr. Paul W. Schleck:

I would question your ability to be a fair and just moderator. I have participated in the rec.radio.amateur.??? newsgroups, I have witnessed your abilities and goals.

There, I have seen you and your extra class henchmen attempt to constantly steer the course of its' flow, intimidation and threats have often been your tools. I have watched you and others look down upon other amateurs who will now be allowed to take a "No Code Amateur Exam." In no way have I ever seen you be even close to being "fair" or "just" in your opinions, judgments, statements, etc. I have heard many in that group call the present amateur exams "dumbed down."

Here, you have blatantly lied as to your purposes. You seek a forum where a very limited band of ideas, concepts, beliefs and discussion can take forth. You seek to establish a "class based newsgroup", this class system will VERY MUCH depend on the ancient art of morse code and the amateur exam.

If any here doubt, they only have to sift though the old posts and check past posts of you and those you name as would be-moderators and they will know. What I say, I say with great belief.

You wish to establish a "masonic temple type of brotherhood" here in the public newsgroups. You and a few of your cronies wish to establish tight and strict control over this group. And, from what I can see and guess to your goals, you do this SOLELY for the purpose of stroking your own egos.

Many of the "weirdos", hecklers and vulgar individuals in the other amateur groups are due to you and those sharing your same views and using your "street smart" methods--in effect, your "control freak" attitude and "better-than-thou" stance has created them.

It would serve justice if you were forced to stay and learn to "get along and play well" with the other "children."

Your words show a fine demonstration of stealth and deception; I don't believe I have ever seen a better example than you have presented to us here. I certainly would nominate you for the "Silver Tongue Award."

However, I would certainly NOT vote to allow you to slink and sneak off from the tragedy you have helped to create.

Although you make this request and proposal out of your personal need to feed your ego, and surround yourself with those who would feed your ego for you, and "live in your own little world", I think it would be a crime to allow you to do so.

The potential you have to abuse this proposed-moderated newsgroup to the detriment of others demands it should not be allowed ... I for one would vote NO, but then, you already knew that ...

Regards,
John Smith I

I am in the process of refurbishing a HQ-170 I bought on Ebay. I am making some progress but I ran into a couple bad parts.

Need:
1. T12 1.8 - 2.0 MC Antenna Coil
2. T28 60 KC BFO Coil

If you have these or one of these or know where I can obtain these, please let me know.

Thanks, Randy, WB5KCM

Dee:

There I agree with you 100%. The vulgarity and sheer non-sense makes me
embarrassed for them. I cringe at the mental state they must exist in
to wish to provide such a display in front of women and younger users here.

I fear that this does not just exist in the newsgroups, here with us,
but also is becoming "something bad" in America :(

I can only admire you in finding the tools and having the determination
to be here with us in spite of all that non-sense ...

Warmest regards,
JS

Sufficient data already exists on the poison content of rattlesnakes. In addition, don't lump all snakes with rattlesnakes. The common garter snake is quite harmless.

In addition, the rattlesnake forms a useful role in keeping rodents and
other small vermin under control.

Sensible people leave them alone and make sure that the snakes don't come
into their immediate area.

I am looking for an operating manual for a Siemens D2155 Level Meter.
Can anyone suggest where to look on the net?
Any help would be greatly appreciated.

Theo

I watched an episode of Drake and Josh
on nick.

their younger sister in the story was a ham,
nice kenwood station too.

anyway, they played trick on her to make her think
she copied an ET signal and 'landed' in her backyard.

note: both of these guys used a borrowed rig and were not licensed
to play the prank.

Your impression of Paul is completely wrong. He is singlehandedly
responsible for the creation of the entire rec.radio hierarchy. He
wrote the charters, solicited the calls for discussions and calls
for votes for each and every rr ng.

It was either Paul or Brian who wrote the Usenet software that's
universally used to carry the newsgroups. (Paul, help me out
here; that seems like a century ago...)

No 73 for you,
Jeff KH6O

I don't know of any accelerated life tests on silk.
Longevity of paper prints depends on the colorantes used in
the ink. The longest lived prints are made from ink
containing pigments rather than dyes. While some dyes are
quite stable none are as stable as really stable pigments.
Some of the degradation of the prints is due to exposure
to ultra-violet light but there also appear to be chemical
effects so the support has a definite effect. You might
check to see if Henry wilhelm has done any testing with base
materials other than paper.

Sorry about this, I was having trouble posting to Teranews
and had to cut and paste several messages to post using
Earthlink.

The message that should have gone out is:
Is it possible that the problem with these coils is that
the connections at the terminals are bad? If so you may be
able to fix them by resoldering or even just reheating the
solder terminals. Its worth a try if the coils are not
damaged in some way.

The Wikipedia article mentions that the father/son team in _Frequency_
used "vintage Heathkit equipment".

They did: it was an SB-301 "transceiver".

That must have been a _really_ potent Aurora!

Oh, let's not forget Brian Kantor WB6CYT (Info-Hams administrator), Jay
Maynard K5ZC (1991 rec.radio.amateur.* reorg proponent), Ian Kluft KO6YQ
(1993 rec.radio.amateur.* reorg proponent), Mark Salyzyn AG4YD/ex-VE3MGS
(rec.radio.info proponent and moderator), Ralph Brandi
(rec.radio.shortwave proponent/FAQ maintainer and originator of the
rec.radio.* hierarchy), Rick Stealey K2XT (rec.radio.amateur.boatanchors
proponent), Richard Eckman KO4MR (rec.radio.amateur.dx proponent) and
many others, I'm sure. I've mostly felt like I've just come along for
the ride, or at best, "stood on the shoulders of giants" like Jonathan
Kamens, Tim Skirvin, Ron Dippold, et al.

>It was either Paul or Brian who wrote the Usenet software that's
>universally used to carry the newsgroups. (Paul, help me out
>here; that seems like a century ago...)

Alas, the only software that's used regularly on Usenet that I had a
hand in was auto-faq:

http://www.novia.net/~pschleck/auto-faq/

Though Brian did have a big hand in the early history of the Info-Hams
mailing list, from which the amateur radio newsgroups owe their origin
via a gateway.

I have some vintage military items FS: These items came from the radio system AN/GRC-19D system. This system had the R-390A sires receivers and the T-368 transmitter. On top of the T-368 was the modulator oscillator for the FSK system. I have one of these in nice original condition for $125.00. I also have the the CV-116 RTTY dual diversity convertor, with manual, $150. Also used in this shelter was the wattmeter/dummyload for the transmitter and I have one of these also, $50. If interested, call Mike at (979) 255-3544.

Thanks for the info Richard, in this case the BFO coil is completly
missing and had been replaced with some other coil. They actually
drilled a hole in the chassis and mounted in this non-standard coil. I
cannot get the BFO to 60 Kcs as required. The 160 meter antenna coil
has a jammed core. I cannot get the core to move. I believe it is
broken inside. I could possibly take it all apart and try and find
some other core to put in there. Possibly could reglue the core back
together. If I cannot find one, this is what I will do. So far I have
not had any response to my parts needs so I may have to try something
else. Thanks

In "Some Like It Hot," with Marilyn Monroe et. al., Joe E. Brown's character (Osgood Fielding III) is shown on his yacht using a Hallicrafters S-20R receiver (?) to telephone the hotel.

http://antiqueradio.org/art/temp/hallis20r.jpg

Have to wonder how that could work, since the S-20R can't transmit anything, and the cord from Osgood's telephone handset is plugged into the headphone jack.

I'm guessing that a propmaster saw the Send/Receive switch and guessed this was a two-way radio of some sort.

Oh well . . . that's Hollywood!

Might give new meaning to the term "ham radio" :-)

How does the set perform with a genuine known-good 1L6 in place?

Has the radio been recapped? Weak performance would not be unusual in a radio full of 50-year old paper and electrolytic capacitors.

Phil Nelson

HOPEFULLY, you have the Heath kit assembly manual for this radio --- make
life MUCH EASIER for your investigation and "kit rebuilding". QST also
featured the DX-100 (eBay acquisition) in a rebuild article a couple of
years ago (total rebuilt including replating the copper chassis and parts)

I'm looking for the little brass screw-eye that screws into
the bakelite base of a J-38 key. Do you have one that you
can spare? Once restored, this key will be installed at the
radio operator's station on board the B-17.

If you can't get the genuine article I am pretty sure
its a generic hardware part.
J-38 keys were used for code training, I don't think
they were ever used on aircraft. I don't know what the
correct key for a B-17 is but suspect its one of the
enclosed "explosion proof" type keys.
BTW, are you the folks who had a flying B-17 and B-24 at
the Burbank airport a couple of years ago? If so they were
nicely restored. The complete lack of any creature comforts
on these aircraft gives one even more respect for the crews
who spent so many hours in them on missions.

Richard,

I may be able to find a usable part at an ol' fashioned
hardware store. The part I need is brass and has machine
threads rather than screw threads. I'm sure someone has
J-38 parts stashed in a drawer somewhere, however...

Oddly enough, our official AAF documentation for the B-17G shows that the standard code keys were J-37 and J-38. I'd have thought they would have used a flameproof key, but it apparently wasn't necessary.

The B-17 and B-24 that tour together are operated by the Collings Foundation of Stow, MA. I toured botha couple of years ago when they were here in Dallas. "9-0-9" is a nice B-17, but there are nicer ones out there (ours is not one of them...yet!). The Lib is one of two flying in the world, the other being the B-24A of the CAF (which is down right now for some major restoration work).

Lack of creature comforts? That's an understatement. It was downright brutal. Just cruising along on a pleasure flight in the B-17 is rough. It's cold, noisy, drafty, there are a gazillion places to bang your head on some sharp object, and so on. I wouldn't trade it for all the tea in China! :)

73,
Dean K5DH

Recapping is the first thing that any person would do, unless he does not know what he playing with.

When a genuine 1L6 will be found, all voltages will be checked to determine whether something is wrong. If not retuning will be attemped befor further investigations.

I recently acquired most of the parts to assembly one rack of this monster receiver - the complete system is a triple-diversity receiver occupying 4 racks and weighing 4368 lbs. What was I thinking!!

I have started a web site with info at http://www.virhistory.com/ham/frr24.htm

Anyway, I am looking for other FRR-24 owners to see if you have any useful info or modules for sale or trade. I still need an AM-452 RF unit (16-32mc), and a PP-590 power supply. Would also like to acquire a CV-127 FSK converter some day too. I have schematics of the individual units, but no overall cabling diagram.

So if you have any parts or info please let me know. Please pass this message along to any friends who might have an AN/FRR-24 or parts.

73 & Have Fun,
Nick KD4CPL

I'm not sure whether I qualify to post notes on this newsgroups, since I don't know what qualifies as a boat anchor radio. I'm interested in general coverage receiving, but I'm not a Ham and haven't got into transcievers or transmitting stations. - I have a Realistic DX-160, bought recently from Ebay, and also a Radio Shack portable similar to the Sangean ATS-909. Is this group directed only to HAM radio, or would general DX receivers also qualify? I would guess that my small portable wouldn't, but I'm not sure about the DX-160?

Can anyone tell me what whether general DX receiving would be within the general subject matter of the ng?

Thanks,
Jim Cate

Hi Jim - Boatanchors are usually very old heavy tube type radio/transmitters
etc.

Probably a better grpup for you is rec.radio.shortwave -- lots of info and
posts about Shortwave Listening and variuos radio madels.

Happy SWL Listening
CL -- Radio Shack DX-398

Hi Jim,

Boat Anchor's are usually heavy radios with big power transformers, and lots of vacuum tubes. The definition has loosened up somewhat to include some of the slightly more modern ham radio gear that is partly solid state, and partly tubes (hybrid).

The only requirement for joining this group is having an interest in things of this sort.

Although there is some discussion of receiving, and such, it is mostly in connection with describing the performance of a particular radio vs some other radio. DX receiving is not in the general focus of this group. There are other groups in the rec.radio hierarchy that do focus on SWL receiving.

-Chuck

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-02-02 02:40:49 UTC
From: COLIN LAMB <k7fm@teleport.com>
Message-ID: <Rwxwh.19750$w91.18928@newsread1.news.pas.earthlink.net>
Source record: 9149

The general category of boat anchors is met by something big and heavy enough to literally be used as an anchor for a small boat.

The true determination is generally made by your spouse. If you can walk in the front door with it, without your spouse asking "and what are you planning to do with that?", it is not a boat anchor. Boat anchors are brought in during the night or on long weekends.

My triumph in a lifetime of packratting was to bring home 14,000 tubes and hide them in the basement and barn so that it was 3 weeks before my wife realized there was more stuff there.

Acquiring boatanchors is an art form. Being on eBay helps. When you sell something on eBay (preferably a small item that you do not need), let your wife know that you have sold something. Say nothing when you acquire things and at first you must sneak in the big stufft.

Remember, that you need to justify the existence of your giant ham shack and storage. When the family tv goes out, this is an opportunity. Take it out to the shop and tell your wife you are going to work on it. Then, early the next morning, before she gets up, sneak out to the shop and get the tv and put it in the trunk of your car. Later, take it to the tv shop to get fixed. Make sure they have your cell phone to call you when it is ready. Then pick it up and sneak it out to the shop. Later, in full view of your wife, bring it into the house and proclaim that your knowledge and equipment has fixed her tv.

The perfect boat anchor collector is Lamont Cranston (aka The Shadow), for he can cloud the mind of spouses so that they cannot see all the piles and piles of boatanchors. At times, I am convinced I have achieved that level, but then my wife exclaims "how come more and more crap accumulates in all the rooms?" But, by quickly changing the subject, the mind control works again.

I cannot tell you all my secrets, but I can now get one or two boxes a week without more than a mutter from my wife. It is based upon years of practice and honing a fine art.

My DX-160 receiver is rather large, around 1 ft, 2 in. wide, and it is
about 30 years old. However, it's solid state, because I was more
interested in using it than in collecting or fixing it up. Years ago I

did use tube shortwave radios (a Zenith table model and a Hallicrafter S-38, when they were popular and in general use.

How do these old tube models compare with current or recent SS models in the same general price range?

Jim

457. Re: Boat Anchor Qualifications?

Source record: 9151

The DX-160 is comparable to the Hallicraters S-85 - a $120 general coverage receiver ala 1958.

The DX-160 is analog and single conversion. That means the dial calibration is not great nor is the image rejection very good above about 12 MHz. Also, the selectivity is average.

For listening to short wave broadcast stations below 12 MHz, the DX-160 is adequate. Really not that bad. But, it lacks a noise blanker, any rejection tuning and is generally just ok.

The modern true short wave radio will have digital tuning, double conversion, excellent stability and image rejection and generally lack all of the qualities that boatanchor lovers covet.

R-390A receivers are big and heavy, but they lack the instability, poor calibration and poor image rejection of many of the true boat anchors. We tolerate those owners in this group merely because the receivers are very heavy and have sharp corners, which makes a great anchor. In addition, they probably can be used for anchors for months before the electrical quality is affected.

Anyone know if the T13, 1.05 to 2.05 Mcs antenna transformer in the
HQ-180 could be used for T12, 160 meter antenna transformer in the
HQ-170 ??

Should work ok. You will need to adjust the inductance with the slug, but
it might tune ok. You may have to fiddle around with a trimmer cap, but as
I recall the antenna peak has a lot of latitude.

Also, What about using one of the 60 Kcs IF transformer for the T28
BFO coil? Possibly use one winding as the 60 Kcs BFO oscillator coil?
Anyone have any ideas or possibly tried this ??

All you need to do is get enough inductance to resonate on 60 kHz, then tap it for feedback (I assume it is using a tap). I used to use old coils out of tv sets to get down there. Get the amidon info on their website and wind your own on a toroid, You could even use a coil out of a low frequency (85 kHz) ARC-5 - the 190 to 550 kHz version. You can often find those butchered.

I had a friend who blew out all of the front end coils when he transmitted into the receiver. He made things worse when he switched bands to see why the receiver was not working. I wound coils on just about anything that was handy and got it working fine. The antenna trimmer takes care of a lot of slop.

You probably want rec.radio.shortwave.

Discussions of general coverage receivers is welcome here, if the receivers
are actually boatanchors. The DX-160 is on the borderline of the boatanchor
mark since they can comfortably be lifted in one hand.

In the case of transmitters, the "watts per pound" measure is helpful to
determine if a device is a boatanchor or not. In the case of receivers it
is somewhat more vague.

>Can anyone tell me what whether general DX receiving would be within the
>general subject matter of the ng?

No, but care and alignment of a DX-160 wouldn't be too far out.

This group really is more about the radios than about their use, in
my experience. The boatanchors we discuss are indeed old, heavy, big
boxes, usually but not always all-vacuum-tube, and usually but not always
rack-mountable. Some examples can be found by Googling on `R-390 OR R-390A
OR FRR-59 OR R-1051 radio receiver', without the quotes; the string _is_
case sensitive: the "OR" must be in upper case to have Google do the
alternation correctly.

Or you can look at the following URLs on my website to see the R-390,
R-390A, R-1051B, and R-1051H:
<http://mikea.ath.cx/R-390/>
<http://mikea.ath.cx/R-390A/>
<http://mikea.ath.cx/R-1051/>

Thanks. I also have a Radio Shack DX-398, which has double conversion, digital tuning, and tuning memory provisions. - Obviously, it wouldn't qualify as a boat anchor, but it's a good supplement to the DX-160. - I wanted the DX-160 because it has analog tuning, and an easily read display. I'm in the process of constructing an outdoor antenna.

To ask whether it fits isn't quite off-topic, but there is indeed
a distinct difference between this newsgroup and rec.radio.shortwave
where the actual questions would belong.

The fact that there is junk here is not an excuse to let more junk
in.

And of course, one could balance the junk with actual on-topic posts.

"How do you keep the spouse from not seeing the FedEx truck, that's my problem....."

Well, if you work, you can have FedEX drop the package off at work (done that). Then, hide the package in the covered pickup and bring it home and wait until your spouse is asleep to cart it in.

At some point, after studying and perfecting The Shadows techniqe of mind clouding, your spouse will not see the FedEx truck. In the end, my wife has given up and simply makes comments on occasion to let me know that her mind is not clouded.

The only problem I have is when my wife goes on a retreat for a weekend with her girl friends. Her friends all tell her how they control their husband and they do not tolerate anything lke she does. It is not intentional or malicious that they do this, just they are using their husbands for their personal welfare rather than mutual welfare. It sometimes takes 2 or 3 weeks before I have convinced my wife that indeed I am a better husband with all of the junk than they are without. I have to convince her that the other women indeed do not love their husband and indeed their husbands have other faults which I do not have. Sometimes I sweat a bit for the first few days as I have to come up with all of their faults and my qualities.

We have been married for 28 years and I do have a 150 foot tower with numerous wire antennas going every which direction, so I have no complaints.

It does require constant vigil, though.

Some ideas I read about:

1) Bring purchase home in trunk of car. Under cover of darkness, move purchase from car to basement window well. Open basement window and bring purchase inside. (Only works with basement shacks near openable windows)

2) Keep large trash can in basement. Make a big show of how much useless stuff you are getting rid of each trash day. Bring purchase home in trunk of car. Under cover of darkness, after trash day, while retrieving empty can, put purchase into can and bring into basement. (Only works with
basement shacks)

3) Mail parts and small purchases to yourself, with computer-made official-looking labels from ham rig makers. Labels should say "FREE SAMPLE" and "FOR EVALUATION BY (your call)". Helps to include official-looking questionnaire and return envelope. (Only works with small items in new condition)

4) Dismantle purchase at friend's house. Bring parts into house using various methods listed above. Mix in with parts stock, which must be big enough that additions are undetectable. Reassemble gradually so it takes shape slowly and is not noticed. "And I built it myself from parts I had on hand". (Works best with kits and homebrew that need restoring anyway).

5) Sell 3 or 4 big things that you don't use and which are virtually worthless, in order to buy one thing you really want. Helps to have lots of useless big things around for such deals.

6) Deny, deny, deny. "That? I've always had that. Got it at the Podunk Hollow hamfest in 1998. Cost over $700 new, I got a deal for less than $50. You just never noticed it before."

7) Ham friend comes over, drops purchase off at your house. Says he's moving, vacationing, having work done to his house, etc., and would you hold onto the thing "for a while" so it won't get dirty, lost or damaged? (Works best if ham friend does you, or better yet 'hon', a bunch of non-ham-radio favors, so you owe him several favors back, and can't refuse

him. Meanwhile you've done the same things for *him*, so he can do the same deal.)

The following three can only be used once, so save them for that dream purchase.

8) If you only have permission to buy one thing, but want two things, have "radio store" (ham friend) send you both. Call "radio store" on phone and complain about second item sent to you "by mistake". Spend a lot of time on phone trying to convince them it's *their* mistake, that you refuse to
pay for the item, it's not on your credit-card bill, etc. Finally have "radio store" send you official-looking apology letter saying they're sorry, they discovered the mistake, and you can just keep the second item for free as a goodwill gesture from them. (Helps to practice one-sided phone conversations by listening to old Bob Newhart routines).

9) Bring purchase into house when no one is home. Wrap up in unlabeled, dusty, old, cardboard box. Hide in unusual place, away from your ham gear - attic if shack is in basement, garage, etc. Bury it under stuff that hasn't been disturbed in a long time, and won't be normally moved.

After a suitable time has elapsed, get family to do "housecleaning". Best if someone else discovers box. You act surprised, overjoyed, cradle unit in your arms, tell family you thought it was lost years ago and you thought it was gone forever, you'd never see it again, etc. Long detailed
story of how you delivered papers for three years to save up for it helps. (Only works with old items that you could have once owned).

10) Go to hamfest. Don't buy a thing (officially) - better yet, sell a bunch of stuff. Leave early. That night, receive phone call from excited ham friend telling you that you won the grand prize in the doorprize/raffle. Pick up "grand prize" (your purchase) at his house - which you dropped off there on the way home. (Only works with new items. Mad scramble looking for raffle ticket stubs in car, clothing, etc., with heroic rescue just before they go in the washing machine, helps divert attention).

--

Not that I've actually *done* any of the above, mind you. Wouldn't dream of it. Not me!

Just something I read somewhere - QST about 1970. Yeah, QST....that's the ticket. Yup, QST.

73 de Jim, N2EY

No, really - there *was* such an article. I'm not making this up. Honest. It was when QST was still in the small format. Had the raffle ticket thing and all. You can look it up.

Would I lie?

Sorry to hear of all the trials and tribulations you guys have,
sometimes. Things are a bit different, here. If I dwell too long on an
item at a hamfest or show a genuine interest in some radio gem in QST,
the XYL will go back and buy it. Well, truth told, she generally asks
first, but not always. My stuff comes through the front door in broad
daylight, unless its just too heavy. If that's the case, she'll help and
unlock the basement door.......... I had to use her SUV to get my T-368
home. No foolin'!!

There is always someone who has it better - but we cannot dwell on that.

I thought I had it pretty good, but I go over to my neighbor's house one hot summer day and he is in a lawn chair under a tree sipping on some lemonade. His wife is at the bottom of a 5 foot hole at the end of a shovel, getting it ready for pouring the concrete for his new tower. His son and his wife had done all of the digging.

Another ham in England reported to me that his wife climbed a tall tree to install the wire antenna and she does all the antenna work for him.

But, volunteering the SUV for a T-368 is pretty good, too - that is a ship or fleet anchor.

In the scrap yard I frequent somebody junked what I think was a "HAM"
transmitter.
It was in a six foot high cabinet. The scrap yard guys removed the
panels and threw the cabinet
into a bin with other scrap steel. What was still on the ground was sub-
assemblies as follows

Two James Millen RF amplifiers (2 - 100TH) Looks like 40M and 10M
Two GATES speech amplifiers with meters
One GATES dual limiter (audio)
One GATES frequency monitor (with crystal oven)
One power supply (using two Mercury vapor rectifiers), looks like
filament and high voltage supply

Located in Sacramento California.

Email for directions to the scrap yard, as I will not buy and ship.
It's a shame to see this smashed for the metal content.

Yeah I really hate to read about all you guys having to sneak
new/old stuff in to the house.
My wife will just look at the new goody, ask what's that
and then just smile.
We're working on our 33rd year of marriage.
I have my display room that was a 2 car garage,
the next to the biggest of the 4 bedrooms for ham shack/office
and boat anchor display, the smallest bedroom for library,
display space for my early electric fans and my Apollo 11 collection,
and the detached 2 car garage for work shop and radio/parts
storage. And there are 6 radios scattered around the living
room, dining room, den and foyer.

I count myself pretty lucky.

Pasternack has the plugs, although they are sadly not cheap. I got a TMC
receiver a couple years ago that had been demilitarized with a boltcutter
and wound up having to buy a bunch from them.

Source record: 9179

Hello Folks,

A while back, I recieved an R-100 receiver. After a period of time searching on the internet, I have been unable to locate much infomation on this reciever. I do know this is nor the R-100/URR built in a portable case with clock-type dial - that seems to be a morale/ entertainment reciever made during WW2.

>From what I have found, this was a rack mounting unit used for monitoring the VLF, LF and MF frequencies, up to 1400 KHz. Somebody has told me that it is TRF. Tuning is performed on what seems to be 4 bands (indicator dial mask is seized). The dial is built like the Measurements Inc. and some URM- signal generators where a common tuning dial is masked by a black disc which is rotated in place by the band knob.

Internal construction is much like the SP-200. All controls are on the lower half of the panel, which is a black wrinkle painted steel plate. The particular radio I have was obtaned within a aircraft-like cabinet, made of lightweight aluminum, rubber isolator mount (four rubber isolators) and a simple hinged top with two twist-latches.

Any schematics, manuals, power info or such out there?

The radio isn't for sale - it is promised to a friend who can get it working again. I would make an exception for any nautical museum looking for such a radio for their collection.

Thanks in advance for the help, any info you can spare will help.

David Goncalves

I didn't think that my DX-160, which was only $64 on Ebay, would be a problem with respect to WAF. However, it came in a huge box, delivered in a big FedEx truck. - My wife wanted to know: What are you going to do with that thing, and, is there something in particular that you want to listen to? - I'm not sure how to explain it. - "News from countries all over the world" doesn't seem to impress her.

What you are looking for is produced by Kenwood and bears the MJ-84 designator.

I am not sure whether it is a discontinued product, anyway you may search it on Google and will surely get some hint on how to get one.

The Italian distributor HSP http://www.hsp.it/ apparently sells it at about 18 Euro (add 30% for dollars) but one should check whether they really have it on stock.

498. SP-600-JX problem and cure

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-02-06 05:07:54 UTC
From: Richard Knoppow <dickburk@ix.netcom.com>
Message-ID: <45c80093$0$16280$88260bb3@free.teranews.com>
Source record: 9192

I have been rebuilding a JX-17 for some time which I
have nearly finished. A couple of weeks ago it developed a
rather mysterious problem, namely an intermittent high noise
level. The noise would sometimes come up and stay for a time
and sometimes just vary around fairly rapidly. I discovered
this was actually a variation in the RF gain. My first
thought was that it was in the front end somewhere but I did
some more thinking and made some measurements. It turned out
to be the filter capacitor for the -10 volt bias supplied to
the last IF stage, also called the IF driver (V-11). This is
a fixed gain stage driving the diode detector. The cap is
C-128, a bathtub type electrolytic. This cap was causing the
bias to be low and to vary considerably. It was also pulling
down the -60V supply for the manual bias (also affects the
AVC) so that bias at the RF tubes was reduced from -41V (at
minimum gain) to about -38 volts. Doesn't sound like much
but its enough to throw off the gain structure.
I am passing this along in case someone else has a
similar problem, perhaps I can save some struggling. This is
the second of these 10uf, 100V bathtub units in the bias
circuit to go bad in this receiver. I think this circuit is
identical in all versions of the SP-600, with perhaps the
exception of the VLF RX.
This particular RX was in storage for some time. What
ever happened to it resulted in a number of the silver mica
caps also going bad. Perhaps this is just typical.
I will be doing a bit more work on this guy, and
another SP-600, I am pretty sure a JX-26 and will report
here about anything interesting I find.
BTW, it appears that the voltages specified in the
charts are very close to the actual voltages to be expected.
Note that most were measured with an old fashioned VOM with
1000 ohms/volt DC ranges. I also found that the chart in the
on-line JX-17 book is missing the asterisks indicating the
voltages to be measured with a VTVM. These are in other
SP-600 handbooks and should be checked and the corrections
entered.
I have had one of these RX for some 30 years and the
other for perhaps 15. This has turned out to be a lifetime
endeavor:-)

Funny coincidence. I just put up my MX-949 adaptor set
which is used with the I-177. It allows the I-177 to test
post WWII and many transmitting tubes.

Bid on both, and bid high! ;-)

One must remember that these guys are 50+ years not a
bad lifetime for these caps. One problem I've had is getting
new electrolytics with really low leakage. I have a few
Sprague Atom caps, which must be getting on for 20 years
old, that have lower dissipation than many brand new ones.
Any suggestions about sources? You would think that in a
city the size of Los Angeles, plus one that is a center for
the electronics industry, that one could get anything even
in small quantities. Not so, its very frustrating.
I also found that the failure rate of the silver mica
caps in my JX-17 is high. Not so in the JX-26. I think the
difference may be that the latter has been in almost
continuous use for the last 30 years where the 17 was in
storage for a long time.

It's really quite simple. Don't make this harder than necessary.
Similar to training a dog, ok? When you train a dog, you do the same
thing over and over till they understand.
With an xyl, what you do is this:
You bring home a boatanchor borrowed from a friend. She will say,
"What is that?" You say, "Oh it's an old radio I am fixing for my buddy,
Joe."
Then, (and this is the extremely important part) you MAKE SURE SHE SEES
YOU TAKE THE BOATANCHOR BACK OUT OF THE BASEMENT A FEW DAYS LATER.
It might be most effective if you do it during dinner hour, right through the
kitchen.
Repeat the above a few times.
I guarantee, after 3 iterations, she won't ever ask again.

Jeep, Thanks for your offer. Actually, I have located a local Ham here in my area that has an HQ-170 parts receiver. I am driving out to his QTH this coming Saturday and see if he has the parts. If I can use you for a backup on this, it will be most appreciated. What I am looking for are these items.

1. T12, 160 meter antenna transformer, p/n K38926-1
2. T28, 60 Khz BFO oscillator coil, p/n M42005-4

The T12 in my receiver does not have a p/n on the can, the other IF cans, etc. do have the p/n. The T28 is completly missing from my receiver. These p/n's that I have are from the HQ-170 book that I printed out from the Bama site. Thanks and I will let you know how my visit goes Saturday. 73 de Randy, WB5KCM

It's far better to foster a relationship of mutual respect, and trust.
I could never live with a woman that scrutinized my every move. Nor
would I ever think I had the right to scrutinize my wife's every move.

Respect and trust. It is the only way. Trickiness and deceit will only
result in a divorce.

"Respect and trust. It is the only way. Trickiness and deceit will only result in a divorce."

So, when your wife asks you what you think of the new recipe she slaved 8 hours making, you have no problems telling her it tastes like crap?

Or, when she comes back with a new hairdo she is proud of, you tell her the old one was a lot better.

When your wife just turns 50 and asks you how old she looks, you tell her the truth?

Sometimes wives do not want to know the truth. My wife would cringe when she saw the checks I wrote for helicopter rental. So, she asked me to create a helicopter account and keep it from her. I did. Soon, it became the expensive aircraft and radio account. She has been happy since.

Honesty is the quickest way to tick your spouse off and get a divorce.

No, I wouldn't tell her it: "it tastes like crap", I'd tell her something
didn't work out quite right, and then I'd tell her what. My wife is a great
cook. She knows when she gets good results, and when he has gotten a bad
result.
>
> Or, when she comes back with a new hairdo she is proud of, you tell her the
> old one was a lot better.

No, I can tell how she feels by the look in her eyes. If she is happy with
the result, then I am happy. It is called being aware of your spouse.

> When your wife just turns 50 and asks you how old she looks, you tell her
> the truth?

We are both over 50, and she looks great. Neither of us are buff 20 YO's anymore,
but I see her physical beauty, and her spiritual beauty... It works for me!

There is one other thing you need to know, a wife that constantly asks land mine
questions is trying to provoke a confrontation. You had better find out what
is wrong, and help make it right.

> Sometimes wives do not want to know the truth. My wife would cringe when

My wife is my best friend, and my partner. There is no way I would try and
shield her from my expense account. Nor would she me from hers.
>
> Honesty is the quickest way to tick your spouse off and get a divorce.

The little lies you tell will build up to a crushing point, and one day you
will discover how wrong you were.

Source record: 9061

As a senior retiree I am 'Elmering' a 15 year old enthusiast (who as a young newcomer to the hobby much to be encouraged, one would think). He has a keen interest in things 'tube'. He is also working towards his ham licence and is enthusiastic and becoming somewhat capable about electronics in a variety of areas. He's collected several interesting radios including a Trans-Oceanic that somebody was dumping!

Unfortuantely somebody 'sold' his parents (the youngsters Christmas gift) at an excessive price a B and K Dynaquik 500, tube tester which is not only somewhat used and very mouldy but also doesn't work!

When discovered not working the seller would not even make an partial or full exchange for an Atwater Kent the young man also had his eye on.

Am therefore looking for somewhere to free-download a schematic. Have tried BAMA and the mirror site, also Nostalgiaair. Unfortunately the available schematics for other models (e.g. the 606) which I have downloaded, are not same circuit.

Some Model 500 manuals are available; but at a cost of up to $38 US plus mailing it's rather expensive concerning an already overpriced unit that may have a major problem such as dud meter!

Any suggestions or other help would be warmly appreciated by both of us.

If there is a more appropriate forum for posting this request I apologise here for being 'Off Topic' and would appreciate direction.

Have you done any googling? There are a number of sites that are dedicated
to tube testers.

> Some Model 500 manuals are available; but at a cost of up to $38 US
> plus mailing it's rather expensive concerning an already overpriced
> unit that may have a major problem such as dud meter!

The meter is really easy to check, set your ohmmeter to a high range,
and connect it to the meter's terminals. The B&K's meter should deflect
on one of the ohmmeter's ranges.

Looking for an old piece of HP gear, can't even remember what it was originally. Doesn't matter, just want the cabinet which can look like anything as long as it's not dented or drilled upon. (Original was a crackled brown) The item may have been their old VTVM, or possibly an audio oscillator. The dimensions are 7 inches wide, by 10 inches high by 13 inches deep. Most readily identified by having 4 banks of louvers sides and top. They made some other items in a box a couple inches shorter and only 3 sets of louvers and I don't need any of those.

What doesn't it do?

Hit the case with Lysol and get the mold off. Then apply power, and
tell me what happens. Can you center the meter? If you put a tube
in, does the filament light up? Is the series light bulb good or has
it gone open?

All transconductance testers are basically a power supply, some series
and shunt resistors, and a meter. Plus a lot of switching. If nothing
works, it's in the power supply.

The JX-17 has all ceramic caps. Evidently it was modified
by a military contractor c.1957. It also has the IF gain
mod. I have not had any problems with the ceramic caps but
there have been a number of other cap failures.
The JX-26 has the original Black Beauties in it. I have
not yet replaced them all but will do so. A number of these
were cracked and a couple so badly that part of the casing
had fallen off. I've checked some that were whole and find
the leakage rather higher than I like. Ceramics have very
low leakage. The other caps in this RX have been reasonably
trouble free. The original filter cap failed and I replaced
it. I also replaced the obviously bad BB's and a couple of
unstable silver micas. I intend to rebuild this one and will
replace all the BBs. Both RX appear to be about the same
age. Internal inspection stamps suggest both were built
about the end of 1954. At this point both are still works in
progress.

"The little lies you tell will build up to a crushing point, and one day you will discover how wrong you were."

Well, actually, I have been happily married for almost 30 years. I am faithful to her and she knows it. I am a collector and she is not. I fly and she is frightened of flying is small aircraft. She golfs and I do not. She tolerates my radio junk. She does not like it and thinks I have more than I need, but she tolerates it because she loves me. She spends money on some things she likes and I could care less and do not even know what it is for. I have a separate building full of my junk and she has no problem with that - she just does not like it when it starts accumulating in the house.

So, the only problem is the things she knows about. One of the bedrooms is my Search and Rescue room, where I have everything I need all over the place, where I can quickly grab and go. She knows about it and does not like it and considers it clutter. But, she tolerates it because she loves me. She would much prefer that I move it somewhere else. Many of her friend's husbands are neatniks - but they are also boring. In the end, she prefers me to someone like them.

And, she does not want to know how much I spend on radio junk or flying.

Could be, I long ago chucked the tube stuff inside, and have no recollection
of what it originally contained. I just need another cabinet like the first
one.

Tnx

Explained that way, your relation ship seems to be a good one.

It isn't dishonest to withold information from someone that wants
to be left out of the loop.

But, that isn't what I was clucking about. The stories that went prior
to yours about how to train your wife by lying to her about repairs
on friend's stuff, or sneaking it into the house, are the ones that
are trouble waiting to happen. We are mostly all adults here, we should
act like adults.

If she's not, I don't say anything, or course I usually forget any
way.

>
>> When your wife just turns 50 and asks you how old she looks, you tell her
>> the truth?

We both turned 50 so long ago it's hard to remember. OTOH she's more
trim now than even back then. Turning 40, 50, and so on has never been
a traumatic occasion for us. Actually, I think I told here she looks
pretty good for such an old gal. OTOH I also told her that yesterday.

>
>We are both over 50, and she looks great. Neither of us are buff 20 YO's anymore,
>but I see her physical beauty, and her spiritual beauty... It works for me!

Both of us were probably in the best physical shape of our lives
through our 40's and into our 50's.

Now I'm the one who needs to lose the weight.
She bicycles several thousand miles a year and works out about 3 or 4

times a week.

I try to work out a half hour to 40 minutes a day on a Nordic Trac and
fly airplanes. Flying does give your legs quite a work out. My
profession was Computer Science and I keep our computers running and
up-to-date along with our own network. That results in far too much
"chair time" which is why I'm the one who needs to lose weight.

>
>There is one other thing you need to know, a wife that constantly asks land mine

>> create a helicopter account and keep it from her. I did. Soon, it became
>> the expensive aircraft and radio account. She has been happy since.

That's fine as it's what she wanted.

It's not uncommon to hear her say, "It's such a nice day, why aren't
you out flying?" She knows what flying a high performance, complex,
retract costs.
My wife pays the bills. She knows where it all goes. I do the
investing. She says I also do the spending, but it pretty much evens
out.

>
>My wife is my best friend, and my partner. There is no way I would try and
>shield her from my expense account. Nor would she me from hers.

We each do our own thing such as biking and flying, but we do things
together as well.

>>
>> Honesty is the quickest way to tick your spouse off and get a divorce.

There is brutal honesty and common sense honesty.
9 times out of 10 diplomacy works wonders with the truth but it may
take a careful approach. After this many years I also know when I
shouldn't say any thing (usually)

>
>The little lies you tell will build up to a crushing point, and one day you
>will discover how wrong you were.

A friend said she and her husband never had an argument. One day she
came home and he was gone. Some people might have to think about that
one for a while but the reasoning is quite evident.

>
>-Chuck

No one is perfect. You know there is, or are going to be problems
when one or both of a couple think the other is perfect. If a couple
never has an argument it means one of them just gives in with out
saying anything.

I am looking for a power cord for a kenwood r-500. I don't know if anyone knows this or not, but N4XFH passed away over a year ago, and left me most of his old radios. I know some of you have done business with Bob in the passed. Well I also need a VS-1 synthesizer for this radio. I am a blind person and could use one of those. If you have such, e-mail back to this address. TNX from n4pge in Griffin, Georgia.

No, I don't think they were. I have known far to many guys
who did stuff like that. They spent their days thinking up
ways to sneak this in, or get out of that chore... before they
knew it, they were single.

Which, I suppose, is what they wanted all along.

On the other hand, there are a number of women that are very controlling and that control unreasonably limits their husband's activities. I have ham friends who do not allow their husband to have an antenna outisde "for fear of neighbors objections". In that case, the neighbors are more important then the husband. Seems like a questionable marriage from the start.

Part of the secret of a long marriage is to find the hot buttons of your spouse and never push them. For me, being late for dinner, without calling, even in an emergency, is not recommended. Another is having the slightest piece of food in the sink when she returns from a long trip. Beyond that, she is tolerant.

I did mention earlier that when she was gone on a long weekend, I did sneak in 14,000 tubes and it was weeks before she noticed them. Is that criminal? A friend was dying and wanted me to buy them from him - so I did. She would not have wanted them at our place and it would have bothered her if, before bringing them home I had said "honey, I am going to bring 14,000 tubes home, what do you think?" When she found out, it was already accomplished. I hid them fairly well, I thought. She found them and tolerated them. Not pleased, but she understands that I have many good qualities. She never once suggested that I was the only man she knew with 16,000 radio tubes. She never said that none of her friends have to live with 16,000 radio tubes.

She would rather spend $300 on a night out. I would rather spend the money on a ratty old radio. My investment is a much better investment, and she knows it. No different than a husband who came to my office one day. His wife had passed away and he wondered if there was anything that needed to be probated. I inquired. They were both immigrants from Russia and washed dishes. I asked what assets they had. He said a car and a few thousand dollars - everything they needed. I smiled and said there was nothing I needed to do. Over the next few months, he brought in many stock certificates found hidden around the house. In the end, he brought in over $100,000 worth of stock certificates (this was decades ago when $100,000 was real money). His wife had spent all their savings on stock certificates. He knew nothing about it. He was happy. The marriage, by your standard, was a total fraud, so they should have divorced, I suppose.

Good marriages are based upon many different things. What works for one couple, may not work for another. I expect that most marriages have secrets between the partners. I am sure my wife tells her friends things about me that she does not talk to me about. I expect I would be disappointed if she did not.

So, even though some of the comments were tongue in cheek and some were not, you have to look at the total aspect. Suppose a husband buys a boatanchor

and sneaks it in the back door. It is really an investment and can generally be sold later for at least what what was paid for it. Isn't that better than a husband who, thinking he is not going to live forever and being worried about money for his wife, buys Enron stock? Or perhaps you are suggesting that before either spouse does anything they need to discuss it with their spouse.

In the end, being judgmental about how someone else lives requires a certain amount of ego. With some exceptions, I try not to judge how others live. My main responsibility is to make sure the sink is clean when my wife gets home after a long trip - and call before dinner if I am going to be late.

Life is good.

Colin K7FM

Thanks Scott and other replies: About to work on it today. Have just
used Javex/Javel/Lysol etc on the inside of the case etc. and what a
strange odour/smell emanated!
Anyway the box and a couple of bits are now drying. The bottom layer
of charts seem glued/pasted into the lid; so who knows what's living
in there?
We have to do some snowblowing outside then trouble shoot the B&K.
Will advise. terryS

537. NC-300 Crystal filter alignment

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-02-08 15:12:01 UTC
From: Al <aschichler@microwavedata.com>
Message-ID: <1170947521.354084.179700@q2g2000cwa.googlegroups.com>
Source record: 9081

I bought a National NC-300 with a damaged phasing cap in the crystal filter a while back, so I repaired it and realigned the whole thing. I thought I had it aligned correctly, but after checking the filter operation lately, I'm not sure if it's aligned correctly.
On the wider crystal filter positions, it seems to work satisfactorily, but in the narrowest position, the peak is not extremely narrow as described in the manual, and the signals are attenuated quite a bit. I'm not positive if the phasing cap is actually in the mid-capacitance position when it's in the middle, where it's supposed to be to align the filter, or not. Also, when it's in the middle, pretty much all the signals are in the notch, so I have to offset it some to hear any signals at an acceptable level.
According to the manual, the signals that are peaked are supposed to be relatively unaffected by the notch, but I don't get a definite peak anywhere. Just a definite notch. I followed the alignment instructions in the manual exactly, and re-aligned the filter several times. It still doesn't seem to work as described in the manual.

I would appreciate any tips on getting this to work as it should.
I do work at a company that has spectrum analyzers with tracking generators and other similar instruments, so I could probably take the filter out of the radio and sweep it if this would enable me to align it correctly.

Thanks,
Al, WA2AS

They are pretty simple filters. The wider positions are a result of
loading down the crystal to varying amounts (and I think in some receivers,
the broadest position(s) may take the crystal right out of the circuit).
The variable capacitor is there to balance out the capacitance of the
crystal holder.

Maybe the crystal is bad? Certainly people did talk of that happening
in some receivers like the BC-348, but then the holder for that crystal
was unusual. If the crystal is bad, then that would obviously affect
operation. Or if somehow it's one of those crystals that has gone
off frequency with age, and you aligned the receiver to a specific frequency
rather than to match the crystal, then that would affect things. (Assuming
you have the means of generating a variable frequency at the IF and a means
of accurately measuring that frequency, you might check the crystal itself,
either out of the circuit or just feeding the signal into the input of the
filter and looking right at the output, one should see a definite peak

at some frequency.)

Thanks:-) I accidently deleted your e-mail from my spam
blocker, please send it again.
My JX-17 was completely recapped at some time in its
life. It has a sticker from a service agency, probably a
military contract, who also installed the IF gain mod. The
JX-26 is a curiosity, the RF deck has been recapped but not
the rest of the RX. It may be that the RF deck is not the
original but there is no way of knowing. The RF modules on
the turret still have the BB's on them. I am careful with
small parts but if you don't have spares things tend to fly
off into the forth dimention so your offer is welcome.
What I am looking for are the spring contacts for the RF
deck. The ones in the JX-16 were damaged at some point.
While I have been able to repair them sufficiently to make
the RX work I would like to replace them. Lots of soldering
but it doesn't look at all impossible. The assemblys are
held onto the deck by solder and appear to be self aligning.
I am also interested in power supply voltages in
receivers. The books specify the voltage at the cathode of
the rectifier to be 305V (max RF gain) to 320V (minimum RF
gain). Both my RX measure considerably lower despite having
good rectifier tubes and new filter caps. Both RX meet specs
for noise and sensitivity. Am I fighting a ghost here?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-02-09 02:24:34 UTC
From: gil <gi1pi@yahoo.com>
Message-ID: <1170987874.740163.78110@j27g2000cwj.googlegroups.com>
Source record: 9085

My 101zd has a long delay on CW, dots and dashes are equally as long and I can only transmit CW on MOX but there is no receive on MOX, if I switch back to PTT there is receive but no transmit, I do hear the sidetone but no clicking of the relays while on PTT. There is no change by adjusting VOX or DELAY.

SSB works fine with no problems.

Can someone help me out?

Gil

Harold -

I own a few modern multimeters, both digital and analog, which I use for work. I also collect and restore tube-era instruments, and use them to repair, restore and calibrate other instruments, as well as to repair and restore antique radios. That is why the cabinets are not available. In any case I would have to charge for an entire restored and calibrated instrument, which a) is far more than the cabinet is worth, and b) I would be loathe to part an instrument in my collection in any case. :-)

>On my list for both the
>Orlando and Charlotte hamfests.

You should have no trouble finding one - several years ago I bought a 400D VTVM in quite decent condition at the Spencer NC hamfest for $10.00. It didn't take much work to put it back into working order - just some cosmetic work, then the usual switch cleaning and calibration.

Decades ago, there was an article in CQ about improving a low end receiver, I think it was the S38. They improved image rejection by adding an untuned amplifier ahead of the receiver. It didn't add much gain, but it isolated the first tuned circuit from the antenna, which improved it's selectivity and hence the receiver's ability to reject images. Kind of neat, though I have no idea how well it worked.

From experience, I might recommend one of the cheaper, tunable MFJ preselectors, with or without a preamp, or perhaps an older Ameco PCLP or Palomar tunable preamp. Any of these will improve the performance of an inexpensive receiver, especially on the higher frequencies. Of course, with any inexpensive receiver, an increase in front-end gain may also introduce an increase in images, etc. There are trade-offs.

Try on old RME DB-20 or equiv. preselector. Variable gain and pretty
good image rejection. Plus your local osc won't be detectable by
hostile submarines. There's one on Ebay currently. Not mine. I still
use mine with s SP-600.

I just use an old-fashioned antenna tuner made with a variable
capacitor to "electrically" tune the random wire. Works just as good,
my S-38C is fully restored and very hot on the BCB and even up to the
11 meter band!

Mine is a 170A-VHF_no clock. The odd ball problem I had was the 6C4 in the first osc caused noise with increased rx sig strength. The original was dead so one was installed from a brand new stick of NIB RCA 6C4s. Sometimes the dials slip too but I still like the radio OK. Hammys are OK here.

Does anyone know how an Amphenol 75-MCIF jack looks like?

Looking at the panel of my Hallicrafters HT-40 transmitter, and having
determined that its diameter is smaller than that of a standard 1/4" inch jack,
I though it was a Collins-style microphone jack.

I tried with that but it does fit. It must be even smaller.

Any suggestion?

Thanks and 73

Found! It is identical to the microphone jack of the Geloso home recorder (1955-1965). Not a terribly rare item here.

Thanks EdZ,
I just picked up another HQ-170 yesterday for a parts source. It is much cleaner than mine but is missing several major components. It is s/n 5792 and my original HQ-170(the one in the photos) is s/n 1902. Actually the one in the photos has been cleaned up and looks even better now. Once I have the new front panel, knobs, etc I will post more photos. Working on this HQ-170 has been a lot of fun. I am now in the process of putting in the BFO coil and the 160 meter antenna transformer. Once I have all the components installed and checked I will finish the alignment. Once I have the radio playing like it should, I will start swaping the front panels, dials, knobs etc. Thanks for the tip about the 6C4 HF oscillator, I will watch for that. I tried to buy a 170 VHF model off Ebay recently but missed it and I think it sold for ~$140, I wish I had made that deal. Thanks for the comments and best 73 de Randy, WB5KCM

And of course, the subject header didn't say it all, since there are various reasons someone might be looking for a given year's handbook, but not all of those reasons actually require the specific year.

Lots of times, people have wanted a specific year, and then it turns out they wanted a certain project from it, and the project was actually in multiple years of the handbook, or of course had originally been in QST (maybe even in a fuller form), and that issue of QST may still be available in paper form from the ARRL (and if not, they may still supply a photocopy of a specific article for a fee).

The handbooks change like glaciers, so unless someone is trying to get a complete set or wants the very same edition as they originally bought, any specific edition is often bracketted by a few years.

But if I got that year, I would get what I want.

What I am actually looking for is the article or project on using 813's
as triode modulators. If that expands the editions, so be it.

JS, Looking at my 1959 Handbook, there's no project using 813's in a modulator, per se. The high-power modulator in that issue uses 811A's. The only project using an 813 is an amplifier, utilizing a single tube. I'll check deeper in that year and see if I missed something obvious and/or imbedded in the text on modulation/modulators.

I have a 1964 (11th edition) handbook here, and it has only one transmitter project which is a little QRP 4-tube set, the Knightkit T-60.

The reference was from an ER article in issue 153-155 by W3BYM. His
email in in qrz so I asked him for more info.

However, seems like QRZ email addys are not much good. Most of them bounce.

What I am actually looking for is the article or project on using 813's as triode modulators. If that expands the editions, so be it.

I will do some searching, but I think the Radio Handbook, rather than the Radio Amateur's Handbook, may have the article you are looking for. I know it has an article on using 813s as triode modulators, which is rather unusual. And, I am thinking it was further back. Will go upstairs to the radio book library and do some searching.

The 16th edition Radio Handbook (1962) has a "Zero Bias Tetrode Modulator" featuring a pair of 813s operating as grounded grid, zerio bias modulators and claims to have 500 watt output. Page 683

I looked in the 11th edition of Radio Handbook and did not find it, but I am about 87.22% certain that one of the Handbooks features 813s utilized as triode modulators.

Will keep looking.

If you want to kludge your filament transformer so you don't have to buy a new one at full list prices, and are willing to cobble together some other transformers, you might want to think about that. I built a pair of 813s in G-G with two 2.5 v/15 amp transformers, and a 6.3 v/10 amp transformer, all three connected in series and a variac (and voltmeter) to "manage" filament voltage slow crankup (to turn on) and crankdown (to turn off) cycling to increase filament life. Pictures at:

http://www.panix.com/~asd

...if you want to see it.

I can confirm that the 1959 ARRL handbook does NOT have any modulator
using 813s connected as triodes. I have several ARRL handbooks, including
the 1959 edition. One of the guys talked about the Bill Orr "Radio
Handbook". I have only one of the editions, 1956, and it does NOT have any
pair of 813s circuit, triode-connected, for modulators. But, it DOES have
a circuit for triode-connected 807s.

The Thirteenth Edition of the Bill Orr "Radio Handbook" (not the ARRL handbook) has an article on a 500-watt, 813 modulator with photos, parts list, and schematic. The next volume I have is the sixteenth and it only has the schematic and parts list. So, you need something around the 13th to 16th editions for the 813 modulator article. --Ed

577. Hammarlund Variable Capacitor MC-325-M and Assorted Radio TV Repair Parts For Sale

Newsgroup: rec.radio.amateur.boatanchors

I have a new Hammarlund variable capacitor for sale, model MC-325-M is the model. This is NOS and NIB and has been sitting on a shelf for many years. $30 plus whatever shipping is.

I have the following old repair parts for sale as a lot or each. These are all NOS and NIB as far as I can tell. Let me know what you are interested in and make an offer. Buyer pays shipping of course.

General Radio Parts 846AK Variable Caps 2-11uuf , 846BK 2.5-20uuf , 119-A Choke .25H , 301 Potentiometer 200 Ohms

UTC Parts Variable Inductors VIC 7 .13 H , VIC 14 3.4H , VIC 18 21H , VIC 21 83H

Peterson Radio Crystals Z-1 Type 5000 , 2500 , 1000 , 500

Hammond Choke 1506 1.6mH

Meissner Parts 19-6842 RF Choke 30 mH , 19-4551 RF Choke 5.5 mH , 19-6846 RF Choke 80 mH , 16-6668 LF Input , 16-6658 Input IF 454Kc

Miller Parts 4525 High V RF Transformer , 6203 4.5Mc IF Input and Interstage , 6204 4.5Mc IF Discriminator , 6205 4.5Mc IF Ratio Detector

5480-C 455Kc Oscillator , 6320 .2-3 mH tapped ,
6196-TV Hor Width Cont 55 Sweep , 6195-TV Hor Lin Cont 55 Sweep

I can provide pictures if you would like. Shipping costs are actual shipping costs, no handling charges. Please quote prices in US dollars. I really prefer Paypal but other arrangements can be made.

Thanks

Dave

Turns out I am using the 10A 813 filtrans for the 8000 which only needs
5A so I cold put that in the modulator and kludge up something for the
8000. This would require less kludging and I am long on that.

Take a look at my NC. The plates didn't line up after making it so I
cut it in half and got independent adjustment.

And for the third time, you still ignore part of the hierarchy.

While the first RFD ignored the hierarchy except for .misc and .policy,
and the second RFD added .antennas and .dx, this third RFD long after
the discussion started still ignores three of the newsgroups in
the hierarchy:
rec.radio.amateur.boatanchors
rec.radio.amateur.digital.misc
rec.radio.amateur.space

In the end, you can't speak for the hierarchy if you don't even
know which newsgroups exist in the hierarchy. No wonder you have
such disregard for the hierarchy, you only think of yourself as some
"administrator" type rather than a participant.

You aren't building bridges, you're imposing your vision on the hierarchy.
The fact that you still don't come to the hierarchy and simply talk to us,
isntead hiding behind the structure of creating a new newsgroup, says
everything about your relationship to newsgroups.

IN the end, I conclude that you like moderated newsgroups because Usenet
never sat well with you, and the only way you can deal with it is impose
your need for rules on something that is a haven from that.

Ultimately, you are like the problem posters. Neither of you can live
without rules, though you need them because you can't tolerate the lack of
rules, while they need them because they think the lack of rules is license
to do as they please.

You've spent the decade trying to impose rules on the hierarchy, while
the rest of us were actually trying to make the hierarchy good by
participating in the discussions.

Useless administrators are always trumped by people doing things.

My wife is a librarian. She loves my getting books. She looks for them
for me, lamintates the covers of paperbacks and helps me "weed" the collection.

She's also a ham, so she tolerates my need for radios.

:-)

The value of the HP 431 depends on the sensor and the cable that plugs in
to the front of the meter. You didn't say what the sensor was

I've been going through the James Bond films that last few weeks,
starting with the first.

There's a whole room of Racals in the first, "Dr. No", which I'd noticed
before. But, a Racal actually shows up in one of the most recent ones, I
think it's "The World Is Not Enough" though it might have been "Goldeneye".
I was a tad surprised to find that, given the age of the receivers at
that point.

Lucky you! Most of the TVs in this house are restored B/W and color sets
from the 1940s & 1950s. No built-in stop action in those days :-)

I just got one and the medallion on the front is missing. Anyone have a spare or know where I can get one or how to make one. The dial cords need to be restrung and there's no diagram in the manual so I'd like to know if anyone has the info in their archives. The cord is quite hard and heavier than anything I've seen before, about 0.080 inch , or 2 mm in diameter pretty close to No. 12 wire. Where would I get some?
tnx

I ran across a web site detailing the restoration of the
Pro-310. I think it was N5QT but I can't get into that site.
According to this site these are particularly difficult
receivers to work on. This fellow has had to have parts made
for it and discusses the dial string problem. If you can get
in touch with him he may have a source for the medallion and
other parts.
I remember seeing and playing with a PRO-310 at Henry
Radio when they were brand new.

According to manual at Bama site,
ftp://bama.sbc.edu/downloads/triplett/850/850.pdf

it's an Eveready #935 or Burgess #1 (see pg. 4).

The PRO-310 is a gorgeous receiver. Unfortunately, it has a case built inside a case and is very difficult to work on. On the broadcast band, it is single conversion, which presents a problem for images.

There were two different color models and they were too expensive to manufacture. They are certainly collector's items.

I just finished rebuilding an SB-401 Transmitter. Looking at the pattern on the SB-610 I have everything looks good except that the patterns are trapezoidal, pinched at the top and splayed out at the bottom. I'm fairly sure its the scope not the transmitter.I replaced the 3RP1 CRT in the SB-610 with 3RP1A because the original would not focus correctly. The voltage going to the CRT are correct within the 10% list in the manual. Any ideas.
Thanks
Jack

Reduce the size of the trapezoid. If the pattern cleans up, it is the
scope.

Well, lots of receivers are single conversion on the
broadcast band and do not have image problems. It seems to
me that the PRO-310 did have some problems, something to do
with the gain structure I think. It got fixed but they were
simply too expensive to compete at the time. For about the
same price one could buy a 75A4, which is arguably a better
ham receiver and could buy RX such as the GPR-90 for less
money.
It would be interesting to know the story behind the
PRO-310, it was beautiful, worked well, but just missed the
mark.

Message-ID: <12td2tj37dkgo3b@corp.supernews.com>
Source record: 8962

I've searched myself crosseyed! Maybe I have the only one Eico made? The "A" is different than the 950 and 950B. Bama has both of those but not the "A"

Help please?
Dick Hall

Did you see the problem with the original CRT?

That sounds like a vertical linearity issue. Look at the vertical drive
tube and check all the voltages around it.

Oh yes... and the usual recommendation for changing paper caps goes here
too. If the drive amp is misbiased you'll see goofy things.

Which is almost certainly correct. The problem is that the
sizes of the various cells have changed over time, as the
"thin layer of cardboard over zinc cell casing" has been
replaced by "thick cardboard jacket over painted tinplate
casing" of the modern "leakproof" cell. I have this problem
with an SEI photometer - you are supposed to strip the card
jacket off the U2 (D cell) before fitting it, as the cell
compartment is insulated with a thin paxolin liner. If you
remove the liner, /some/ modern 'D' cells will fit, but
certainly not all brands of them.

Try zinc-carbon (not alkaline), and either military surplus
(which may still be the non leakproof style), or the very
cheapest cells you can find. Failing that, you'll need to make
up a dummy cell that takes something smaller (AA is probably
too tall, maybe an 'N' or 1/2 AA).

Good luck! (I have this problem with discontinued radio batteries.)
Chris.

Focus problems on CRT's that have normal voltages are generally caused
by poor cathode emission.

A nearby magnetized object can cause display linearity problems like
you mention.

624. Neutralizing a Triode

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-02-17 19:46:35 UTC
From: Jack Schmidling <arf@mc.net>
Message-ID: <12temsnbsmtu975@corp.supernews.com>
Source record: 8968

I need some help and can not find the answer anywhere.

When neutralizing a triode, how much leakage between grid circuit and tank circuit is allowed?

I am looking at the output of the final loading cap with a scope and get a few volts of RF when the NC is nulled. This is with 20 ma grid drive or about 10W input. The output just tickles the wattmeter on the 30 watt range and rises to about 10w when the NC in moved from the null position.

Second question: should I see any leakage when the filament is off?

Thanks for your help.

Jack

What type of circuit: grounded grid or ground cathode?

Grounded grid with input circuit below chassis should require no neutralization. The chassis provides isolation.

Leakage with filament 'OFF' is common in a grounded cathode circuit' The inter-electrode tube capacitances are still there. So, circuit stray capacitance and tube capacitances still need compensation.

Leakage with the tube removed indicates inductive coupling between the input circuit [grid] and the plate tank circuit. Either a lack of input stage to output shielding or the two tank circuit coils are not at 90 degrees relative to each other [90 degree orientation yields minimum mutual inductance].

It missed the mark in its day but today they're scarce and quite
collectible. I recall reading the review back in 56 when I was in high
school and have been after one ever since. this is the second one I've
ever seen. Kinda like if there was only one dandelion everyone would
like to have in their lawn.

At the risk of denigrating your lot of tubes, truth told, after cost, packing, and shipping.... it probably doesn't pan out. The lighthouse tubes are useful only to a special few, the 2E26s were popular but plentiful. The 2E24, used in the likes of the RT-66/67/68, are somewhat useful. Good tubes, I just guess nobody is needing them, at this time.

"Well, lots of receivers are single conversion on the
broadcast band and do not have image problems."

Well, that is true, but what I left out was that the if is 50 kHz. It is the only radio to my knowledge that runs 50 kHz ifs with single conversion.

The bandspread tuning is quite unique. There was supposed to be a run of 1,000 - but I bet less than 100 are still around. Maybe the other 900 are still in a warehouse and will show up on the surplus market one of these days - ha.

I have one.

I just tried it without the tube and it seems to have nothing to do with the tube. When both input and output are resonant, 5 watts in gives me 5 watts out.

The input is a toroid under the chassis so it is not likely inductive coupling. What I just found was that it goes away when I disconnect the NC at the plate end.

What on earth does this mean?

The neutralizing capacitor compensates for the grid - plate capacitance
and possibly other
feed back paths. The maximum balance required depends on the gain of the
amplifier stage.

The balance has to be sufficient to keep the amplifier from oscillating
and a little bit more.
Assuming a gain of 10 dB, then the output with drive and the filament
off should
be more than 10dB below the drive level.

Usually a grounded grid stage doesn't require neutralizing because the
grid is grounded interrupting
the input to output capacitance

Cheers
Bill K7NOM

Check these specs out. Looks like a modern AA will way outperform an old
935 carbon zinc C cell hands down. Just wrap your AA alkaline in paper or
cardboard, wrap in electrical tape or spend the money for heat shrink and go
for it.

References:
old C cell (1800mah) http://data.energizer.com/PDFs/935.pdf
New AA cell Page 9 (2850 mah)

Hello Jack,

In order to neutralize a triode you must have a balanced grid circuit. You build the input tank circuit just like you would if you had 2 tubes in push pull but rather than connecting one side of the grid circuit to a second tube you connect it to your neutralizing capacitor. The other side of the neutralizing capacitor goes to the plate of the tube.

A bridge or single ended type grid tank circuit will work with a tetrode but the triode needs the balanced circuit in order to get enough feed back.

You could also use a balanced plate circuit like you would use with a push pull circuit and a single ended or bridge grid circuit but a balanced grid circuit is usually much easier to do than a balance plate circuit.

50Khz, I will have to look at the schematics. I knew
there was a low frequency IF involved in order to get sharp
selectivity using conventional components. 50khz _would_ be
likely to have problems with images.

thanks. I just have no need for RF xmit tubes, and have been trying to
sell most all of them over the last year. Most all the TV sweep types seem
to sell fairly well... 6JE6C, 6LB6, 6JB6A (still have some pairs of
those)... but these 2E24, 2e26 etc, just havent sold... I looked at the
"catalogs" and they are $5-6 ea new, so I figured $9 for 20 of them used
should be fair...

I was posting about some RF tubes I am selling and thought I would mention here that I am a specialist in controls. Carbon or wirewound. I can make most of the rare types used in consumer or communications radios. Concentric shafts, even. DPST switches... WW with power switches... dual ganged.... Go ahead, challenge me.

So if you are needing a control, or a new power switch installed on one you have, see me!

Hi Mark,

I wheel and deal tubes too and sales are just crappy right now. Since Christmas, the dropoff has been worse than last year at this time by a big bunch.

Hang in there!

Cheers,

Gregg

It's single conversion on the two lower bands below 2.2 Mc, IF is 52Kc
on those single conversion and 1802 Kc with double conversion on the 4
upper covering up to 35.53 Mc. Hey an expensive Q5er!

I just took some shots of the beast with I'm guessing 35 years of dust
because I found a page from ham radio magazine, a Robot ad with ham
frequency allocations for Nov 1972. The ad has about the same amount of
dust on it as the radio. The 65 lb beast looks complete and original
except no medallion on the front I need to find one or get one made.
Several pics going up on the binaries.

W8ZR has a Pro -310 on his website. No medalion.

He mentions that the cabinet was wrinkle with black with gold trim or grey with silver trim. Somewhere, I think I read that at least came out of the factory in baby blue but maybe that was actually grey that had changed color slightly or viewed under special lighting.

Note on the radio shown at W8ZR, that there is no medalion. It is possible that one of the runs did not have it.

Mine does have a medalion, although it is some distance away right now. It is the black and gold version. I do have the manual with a photo of the medalion that could be used to recreate one. Someone with a bit of time and artistic ability should have no problem getting something that is close enough.

Let me know if you would like me to scan it. The copy will not be particularly good, but should get you in the ball park.

I suspect the NC is NOT providing feedback of proper amplitude AND phase. A connection from the plate to the grid is inadequate. The feedback MUST connect into the grid tuned circuit.

Another reply speaks to this issue.

It seems to me that Hallicrafters did the same thing with
a couple of their receivers. BTW, I _thought_ there was a
PRO-310 handbook on the web and that I had it. Evidently its
not so. I found some advertising and nothing more.

I have a balanced input. It happens to be a toroid but I started with a coil and two gang cap.

I got off on a tangent when I removed the tube so I now understand what happened there.

My question really was looking for how much is enough? All the old books say when the final does not effect the grid drive, it is neutralized but everyone has a scope these days and it is so easy to hook it to the output and measure the exact feed through.

I was looking for a number and I believe someone said 10 DB down from input if the amp has 10 DB gain, so I guess I got the answer.

I am not quite sure how to translate this to volts at the output. Or can I put in ten watts and only see the needle twitch on a 30 Watt FS wattmeter at the output and consider it done?

I've seen charger kits that come with those, presumably they are
getting enough power into a the AA NIMHs that they only reason they
can't be used in things that require "C" and "D" cells is their size.

I think the original poster said this RX had been in
storage for many years. Perhaps it would be worth searching
the area where it was stored for the missing medallion.

You can call Chuck Rippel and buy a totally overhauled one. Admittedly,
it's over a thousand bucks, but it's reliable and guaranteed, which is
almost certainly not the case for Ebay items.

Does anyone have a guess what value choke L112 found here
http://www.ppinyot.com/hammarlund.htm#Power%20Supply%20Choke
might be? I am getting a 190 ac volt drop across this puppy. It has a cold DC resistance of 97 ohms. How I got there is also explained at the hyperlink page above.

The short of it is, the negative bias voltages are down across all associated tubes that share that supply. Google is no help.

Even a guess at this point would be nice. I have never calculated a choke in this configuration before.

Just some thinking out loud (or maybe its finger
thinking).
1, Problems with chokes are usually either open windings,
shorted windings, or shorts to the case or core. Open
windings result in very high resistance or a completely open
circuit. Shorted windings result in lower than normal DC
resistance and lower than normal inductance. Shorts to the
case or core can be checked with an ohm meter. One can also
get high resistance "shorts" resulting in leakage from
winding to core. This is best tested using a special very
high resistance ohm meter. In any case, it does not sound
like you are having any of these problems.
The HX-50 appears to have three supplies, a high voltage
supply using the 5R4 rectifier with plates connected to the
outer windings of the xfmr, a low voltage supply using the
silicon diodes connected to the inner windings, and a
negative or bias supply using a single silicon diode
(CR-106) connected to the tap on the winding. If your bias
voltages are down but the B+ voltages are about normal I
would suspect the bias supply. Its possible the diode is bad
but they usually go either all the way open or all the way
shorted. A multimeter will check it. I am more suspicious of
the filter capacitors, C-176, C-177. Its also possible that
something has happened to R-168, the current limiting

resistor, or, perhaps one of the other resistors.
I wonder if anyone has a cross-reference between
Hammarlund part numbers and their specifications. I ran
across a web site that has a cross-reference between "old"
and "new" H part numbers, perhaps there is somesort of
catalogue there. I haven't looked. It would be useful to
know the inductance of L-112 and its DC resistance. The
inductance being off would also be an indicator of problem.
Again, if its the bias supply that has the problem I think
the choke is a red herring.

I have an interview on tape with Frank Lester W4AMJ (then W2AMJ) who was Mr. Hammarlund from 1955 to 1970. When he was hired by Lloyd Hammarlund (son of the founder) he found the Pro-310 did not come close to specs. He and the Engineers spend quite a bit on bring it "close" to apecs.

The reason you don't see many is that the turret costs $85 per unit. That is what there is the box within a box. Hopefully the band switch cable has only fallen off. Otherwise its a nice box outside and a real dud inside. Lloyd put a stop to production after only a few hundred units!

Frank found that none of the Engineers were hams. Since Lloyd cut off the funds Frank went to work to get some of the Engineers to be hams. He went to work on what saved Hammarlund (outside of several commercial ventures) and that was the HC-10/SPC-10 SSB/CW converter. Frank wanted to use crystal or mechanical filters but Lloyd asked for alternatives (they were cheap)which is the principle reason for the 60 kcs IF's found in the HQ-170, HQ-180, and the HC-10. Lloyd kept the old SP-600 series alive by selling the SPC-10 at several times the HC-10 price to the thousands of users.

But never fear, the idea behind the Pro-310 stayed alive in the guise of the HQ-215.

Hope the Pro-310 turns out to be a great piece of History. Frank could never say why the H emblem was missing from most of the units.

Source record: 8920

"I am not quite sure how to translate this to volts at the output. Or can I put in ten watts and only see the needle twitch on a 30 Watt FS wattmeter at the output and consider it done?"

Neutralizing a triode is not rocket science. If you are using a final with a lot of plate dissipation, they do not get hurt when the neutralization is not right. In the old days, many hams simply fired it up and tuned the NC until bad things stopped happening. they did it with high voltage on. Some of them got shocked.

A 30 watt FS output meter that barely twitches when driven by 10 watts and the NC tuned for minimum may be enough. All you need is good enough. No extra points for perfect neutralization.

To test, put a load on the amp and remove exciter. Turn on and tune input and output tuning and see if it takes off. If it does, back to neutralizing step 2. If it works as supposed to, then connect the antenna and start calling CQ DX.

The choke has AC going through it, since it's on the input side of the rectifier. My guess is that it's not just a normal choke but is a swinging choke with a controlled saturation characteristic. It's acting as a current regulator; as current rises the magnetic flux in the core rises and at some point the core saturates and the impedance of the winding shoots way up, reducing the current flow.

A 190V drop across it might be normal, or it might be a sign you are trying to pull way too much current through the thing. What voltages do you measure across C162 sections A and B? They should be fairly close to the maximum capacitor ratings, I suspect. If they are within a reasonable range, I'd say the swinging choke is fine, otherwise I'd suspect something is on the secondary side is pulling too much current and it's hit the wall.

If it IS failed, Peter Dahl can probably rebuild it. You won't be able to just drop in something off the shelf, and sadly design of saturable reactors and magnetic controls and amplifiers is a lost art today.

But that is exactly backwards from the way chokes work. As the current
rises, and the core approaches saturation, the coil starts to lose the inductance
enhancement provided by the core, and it approaches the inductance of an
equivalent air core choke. That is, the inductance *drops*, and the inductive
reactance *drops* and the AC current shoots way up.

Hi,

I checked the L112 choke in my HX-50, and it is 75 Ohms d.c. resistance.
That is in the ball park of your 97 Ohms measurement.
That same choke also serves as the high voltage choke,
since it is in the common center tap return for the medium voltage
and H.V. taps as well as the bias tap.

In standby, I measure 195 VAC across the choke.
So, it sounds like your choke is innocent of the low bias
readings.

Have you put a scope across the bias supply capacitors C176 and C177?
They may need changing out if there is excessive ripple.
The 680 Ohm resistor in series with the bias supply may have increased
value.
Did you check the value of R142 and bias adjust pot R143? They may be
dragging down the bias voltage.

You might measure the bias voltage with the 6DQ5 final tube removed.
If the tube is gassy, it would tend to put a + voltage
on its control grid, which may be working backward
in your bias supply, making the supply less negative.

73,
Ed Knobloch

I doubt very much that L112 is faulty. The bias supply
capacitors, rectifier and resistors are much more likely
to be bad.

No, it doesn't.

It has pulsating rectified DC going through it.

There are two reasons why it is in the center tap lead:

1) All the power supplies can share it

2) Insulation requirements are less.

>My guess is that it's not just a normal choke but is a swinging
> choke with a controlled saturation characteristic.

Agreed.

> It's acting as a

> way up, reducing the current flow.

Not exactly.

In a choke-input filter, the inductance must be above a certain
critical value or the filter isn't really a choke-input filter.

This critical value (called critical inductance) is directly related
to the total load resistance. The lower the load resistance, the
less inductance is needed. The load resistance is just the output
voltage divided by the total current delivered by the rectifiers.

In a transmitter, the load resistance and current vary
all over the place with keying, modulation, loading, etc.

The inductance of real-world iron core filter chokes depends to a
certain extent on the direct current through the choke, which
magnetically saturates the iron. One way to reduce
this effect is to include an air gap in the iron core. The wider the
gap, the less the inductance variation. But such
a gap reduces the overall inductance.

If a choke with constant inductance were used, it would
need to have enough inductance for the lowest-current/highest load
resistance condition, yet enough current
capability for the highest current condition. That means a wide air
gap. Such a choke would be large and expensive.

Instead, a choke with a narrow air gap is used, Its inductance
varies with the current - more inductance with less curren,
less inductance with more current. This is exactly what is
needed with a choke input filter. Such chokes are called
"swinging chokes".

The power supply for my 150 watt homebrew rig uses a swinging choke in
the high voltage supply. This choke has 25 henries inductance at 30 mA
DC but only 5 henries inductance at 300 mA DC.

All of the rectifiers, filter caps and resistors in the power supply
section are suspect. This is particularly true if any
selenium rectifiers or carbon composition resistors were
used.

Dave
Thanks for the history. The turret looks very much like a bigger copy
of the TV tuner turrets from the late 40s and early 50s. It's a good
idea but too expensive. I guess the emblem was glued with some pretty
sorry adhesive as I can't see any residue from where it should have
been. If it was poor adhesive and they were falling off there should
be a spare or two around. Wish I could find one.

Hi Gang:

This is a nice old G.E. loudspeaker. case is heavy metal and measures 6-1/2" by 6-1/2". My guess is that it came from a communications console in some fire or police department from the 1950s.

I'd like to get $15.00 for it plus postage. Any takers?

If interested please reply by e-mail.

73,

Michael,

That makes perfect sense to me. So how _do_ current-limiting chokes work,
then? I always assumed they worked as I described but I may well be wrong.

On DC, they can't! No way, no how.

On AC, a choke can limit the current by being a reactive component...
kind of a lossless resistor for AC.

But! Swinging chokes always reduce their inductance when the current
rises. They typically have a 100:1 change in inductance over their
design current range.

Right, but I was thinking that in the position where that coil is in
the circuit, it's directly in series with the AC coming off the transformer.

How does the reduced inductance translate to higher series impedance?

It doesn't.

Where did you get the idea that such an inductor exists?

A swinging choke aids in the *voltage* regulation of a choke input
power supply by having a high inductive reactance at low currents (where the
supply would tend to be too high in voltage), and having low inductive
reactance at high currents (where the supply would normally tend to droop.)

Is that what you are thinking of?

-Chuck

Ahh! So the increased current causes the inductive reactance to drop,
causing the series impedance to drop. That makes sense, so long as the
source impedance is the same all the time, right?

If the source impedance changed, it could either help, or hurt the process.
It would all depend on how it changed. But I would expect that for the
usual diode, and transformer combination, the source impedance should be
pretty stable.

For a swinging choke to work, the power supply must be choke input. It
is necessary that the choke see the massive AC ripple that comes out of
the rectifier. No ripple, no regulating effect from the reactance.

Okay, wait a second.

You're talking about a configuration where the choke is seeing both AC
and DC on it, and both are required for regulation. The impressed AC
is modulated by the DC, correct? As the DC voltage changes, the inductance
changes, so the reactive part of the impedance changes and the AC voltage
changes. Do I have that right?

I was thinking about a configuration where the choke sees entirely AC,
which would be a different thing altogether, like you see in arc lamp
power supplies. I thought they worked the same way but it's clear they
don't.

I've never seen or heard of a steel 6SN7 and I started with tubes in the early fifties. Now you have me wondering about metal tubes and except for 6L6 most were real popular in car radios and 5 tube ac dc, also military. Does anyone recall the first metal tube, who made it, why and what they touted as their advantage other than it wouldn't break if dropped. I also recall a real hi power amp being made with 6L6s that were cooled by them hanging udside down from the chassis in a bowl of water and others immersed them in oil.

Steel or other sort of metal, i'm not sure - seems to me - there was in fact a metal 6SN7. I further believe I have one in my stock of tubes - somewhere. IF I can find time to look - and do find one - will send the interested party - a photo of it.

Hi,
It was only made with a glass envelope. Some had metal bases.

You could be right, I'm only going on "fleeting" memory. I do recall though - seeing a few "metal" tubes in High School shop class way back when - and as I said, I am sure I have a metal tube or two in my stock. As to the number, who knows! I do know - about 14 years ago - I smashed a LOT of tubes used in older radios of the 40s and so - and more so of car radios and tvs. Try as I might to get rid of them then, no luck. E-Bay was not yet born - DAMNED! Now I have to look in my tube stock, the curiousity is getting to me.

AFAIK no metal 6SN7 tubes were ever made. Metal tubes
were announced about 1935. The idea was that they were
self-shielding. For a time the use of these tubes in radio
sets was advertised as meaning they were the most up to date
designs.
In comparision to glass envelope equvalent tubes metal
tubes generally have slightly higher inter-electrode
capacatance and also sometimes had problems with sealing.

Metal tubes were the first octal based tubes (1935). The GT came later.

Tube Lore, by Ludwell Sibley (http://www.eht.com/oldradio/tubelore/) is a must have if you want to go deeper into the history of tubes.

The 6SN7 was always a GT.

Steve.

Here is a link to an old "Woodie Deluxe" circa 1946 to 1948 that came
with a metal 6SN7 as the preamp.

http://www.ampwares.com/ffg/deluxe_woodie.html

This next link shows a guy that had 10 of them for sale.

http://listserv.tempe.gov/admin/WA.EXE?A2=ind0003&L=heath&F=P&I=-3&S=&P=46879

Here is a quote and link to a store that has them in stock.

"Whether you need a specific nuvister, or the
metal version of a 6SN7, we've got it in stock."

http://www.wizardelectronics.com/parts.htm

It is possible they might be referring to the metal base in all these too.

I couldn't find a good picture of one in my limited search.

Well, it looks like there _were_ metal 6SN7's, the
amplifier definitely has three glass and two metal tubes.
Its odd I can't remember ever seeing one and I have been
working with tubes since there was nother else.

The code hating losers were too stupid and lazy to learn and use CW,
they're also probably going to be too stupid and lazy to solve TVI
and interference problems with their neigbhors. There will be more
amateur to amateur and amateur to non-amateur conflicts. Hams will look
bad and the FCC will regulate the service more because of all the retards
we let have HF privledges. CQ Breaker, CQ Breaker.

Welcome to CB everybody.

This is a wild guess but as best I recall the 6SN7 was used mainly in
low freq. multivibrator circuits in radar and TV and weren't shielded so
there was no need for a metal shield. It cam after the craze of metal
tubes wore off.

There were metal dual-triodes, like the 6SU7, that had the same basing as a 6SN7. And there are lots of popular metal dual-triodes with different basing (I'm thinking esp of the 6SC7).

I'm sure that some of the wash houses cleaned off 6SU7's, found the market wanted more 6SN7's, and painted them as 6SN7's.

I'm 100% certain that some of the old-time retailers mentioned elsewhere in this thread were selling washed/relabeled tubes. Heck, it happens today still!

Tim.

721. Boycott ARRL/QST advertisers

The planned special event operation this weekend by the American Radio relay League to celebrate the "end of Morse code" is insulting and indicates the organization's desire to divide the amateur community. As such we are calling for amateurs worldwide to boycott ALL PRODUCTS advertised in QST and email the manufacturers that you are doing so and why you are doing so.

This is a good argument to strongly tighten up the technical requirements
for the license, not an argument in favor of CW requirements.

And I do agree that we need to strongly tighten up the technical part of
the tests.

I've been in favor of this stance for almost a decade.

In my Y2K restructuring comments, I argued for a reduction in the number of license classes to only 2 (One >50MHZ only, one all privileges), ultimate elimination of the code test (I favored a 5wpm reduction with eventual 'sunset clause' once the treaty requirement was changed), and strengthing the theory examinations.

The problem I see with the theory examinations, as currently structured, is they do not require applicants to demonstrate a full understanding of the topical material.

For example, the way the current examinations are structured, you could get wrong each and every question on rules and regulations -- yet still pass the examination because you have good math skills.

Instead, I feel each applicant should be required to pass every sub-element, with a score of 70% or higher. So, you would have to get 70%+ on the rules and regs, 70%+ on antenna theory, etc. I made many of these points in my Y2K restructuring comments.

However, it is highly unlikely that the FCC will ever adopt such a strategy. The trend is to make licensing easier and easier. I suspect over the next 2 decades you'll see a further push to weaken the theory examinations. Probably not for the next 5 years or so, but eventually some people will start to make the claim that the "hard" theory exams are keeping "potential" people away from the ARS.

This is unfortunate, because in the long term I do not think it helps the amateur radio service. Our knowledge of things "radio" -- propagation, electronics, etc. -- is what has set us apart from other "consumer"-type radio services.

Source record: 8874

Well, I am finally going to try to satisfy my lifelong dream of owning a Hallicrafters SX-28 or 28A. I am currently looking for as good a unit as I can possibly find. I would prefer one that has been restored to the extent of replacement of all paper capacitors and out-of-spec resistors. I want a really good one.

I will purchase if we can agree upon a price, or I have to following gear available if a trade is preferred - I would rather trade:

1) Icom IC-2KL solid state amplifier with p/s and IC-AT500 automatic antenna tuner

2) Icom IC-756Pro II

Obviously there would need to be some cash involved also depending upon the agreed upon value of the SX-28.

If you've got a beauty you want to part with please let me know and let's talk.

These Q&A manuals don't do dick for "teaching". All they do is give the possible answers, the right answer and a hair off a nats ass of an explanation as to WHY it is the answer. I've got FCC study guides that were VAGUE to say the least - one sheet of paper - front and back. They didn't give you the "exact" questions which "might" be found - only samples of the types of questions. Years ago - when you took the FCC exams, if you didn't know electronics - either from school OR some decent "Heathkit" Ham Prep Courses, you were pretty much destined to fail. Many today are just studying these Q&A guides to get their license and letting the ball drop there - UNLESS they want to move up - then they buy the next Q&A and repeat the same process - not really learning the ins and outs. YES - they learn what a resistor looks like - what it is supposed to do and so on - but NOT in depth as they should. Same with many other parts. And even at that - they learn only a small fraction of what any "electronics tech" is in need to know to try to function at least half way decent.

I welcome new hams - but they really SHOULD learn the ropes to get maximum benefit out of their hobby.
Only THEN can they enjoy many of the things ham radio affords the hobby.

Just my 2 cents.

Lou

I have to agree.... I am surprised at the wholly naive (and incredibly basic) questions I get from not a few newly licensed Extras. Of course, I give the best info I can and try to help. But, I am still surprised and maybe a bit disappointed.... Hopefully, and with time, they'll assimilate the requisite knowledge. Dunno... maybe I'm expecting too much?

When I took the General Class exam in 1953, I didn't
know anything except high school algebra. I *memorized*
the ARRL License Manual in order to pass the exam and
I just *memorized* the new frequency allocations 54
years later. Human memory should not be underestimated.

Nope.... I don't think I'm forgetting anything (regarding this discussion, of course). In past times, the Extra did, indeed, connote something more than the passing ability to zero the ohms scale on a Simpson 260 or use of a U-Test-Em tube checker at the local drug store.

Right, but the original notion was that someone would get a Novice, operate
for a while, get a General, operate for a while, and gradually work their
way up the ladder while taking an "entrance exam" at each one. This no
longer really happens... we get folks coming in as Generals or Extras.

Are you familiar with the current 4b question pool? There are 500 questions selected for a 50 question test. I am a BSEE and I believe that the questions are by and large very good and not particularly easy considering that one is not trying the get a degree or pass a PE exam. I scored 100% on the test the first time I took it; however, I put in several hours of study because it covered several areas that I needed to review and/or catch up on. I would not characterize it as trivial. In theory the 500 questions could be memorized by I think that would be much more difficult than learning the material as a way to pass the test.Also, rote memorizing will cause one to learn more than one might think. In College chemistry I had to memorize the activity series of the periodic table, something that has benefitted me greatly during my EE career (because many EE's get invoved in so many other areas than EE). Either method is valid but I would think that most learn the real material these days and the questions are not insignificant. They don't compare to operating a tube tester or zeroing an ohm meter. Element 3b is another story and that one does need a little work

The current Extra exam is simply Element 4 and encompasses the material from
the old Advanced and Extra. There are over 800 questions in the current
Extra question pool.

That means boycotting pretty much everything of any value to amateurs,
doesn't it?

Good luck with that...

(For the record, I agree that eliminating the CW requirement was a HUGE
mistake on many levels that will come back to seriously bite us in the
ass, soon.)

It is highly unlikely anyone "rote memorizes" the question pool.

When people use the term "memorize", they more than likely mean "word associate".

Via word association, they are able to recognize the correct answer to the question simply out of habit... much the same way you "memorize" the way to travel to different places, even though you may not know all the street names along the route of travel.

Increasing the size of the question pool does not eliminate this. All it does is increase the amount of time someone has to spend reading thru the question pool before they become adequately familiar with the material.

Furthermore, with the way the exams are structured (70% overall grade), someone could simply opt to skip an entire sub-element, because there are only 2 or 3 questions from it on the exam, and it isn't worth the effort to even review that material.

OK, I disagree. Try this:

E4C14: If a receiver tuned to 146.70 MHz receives an intermodulation-product
signal whenever a nearby transmitter transmits on 146.52MHz, what are the
two most likely frequencies for the other modulating signal?

A. 146.34 and 146.61 MHz
B. 146.88 and 146.34 MHz
C. 146.10 and 147.30
D. 73.35 and 239.40 MHz

To answer this question, you either rote-memorize the answer, which would be
unlikely due to the size of the question pool, or you aquire at least a
basic understanding of 3rd order IMD to be able to answer the question.

I had a few hundred 6SN7 tube pulls. A few years ago, I went through the entire box looking for a metal 6SN7, for the visual effect in a homebrew regen. I could not find any. I thought I recalled seeing one, too.

Sadly, this may be the first positive proof that the memories of all the old timers are collectively failing at the same time.

Not too long ago, I built a regen using a 6SJ7. I knew I had a red RCA somewhere and looked and looked to no avail. Finally, when I was looking for something else, I came upon the red one. Sure looks pretty.

I have checked all of my RCA handbooks, and they
only list the 6SN7GT.

If there were true metal 6SN7's, RCA didn't want to
talk about them. They must have been made by someone else.

Red RCA tubes were from RCA's industrial tube line. They
were supposedly higher quality than the usual faire.

Regarding the old timers collective memory failing - NOT GOOD - I am only 49. I came in with tubes and solid state - though I had access to tons of tube sets and items associated. Darned it Colin, I was feeling younger than my age - til I read that! :)

I've got to dig out my box of tubes, the curiousity is really getting to me.

There is a plugin for your browser on the LizardTech site. However, a
better bet is WinDjView which is a "viewer" just like Adobe's free
viewer for pdf files. WinDjView (and MacDjView) can be downloaded
from http://windjview.sourceforge.net/
Remember this is a viewer, so you download the djvu file to your
computer and then open it with WinDjView by double-clicking on the
djvu file.

Dave, You have some choices. Antique Electronic Supply and Surplus Sales of Nebraska both offer said-to-be-new can-type electrolytics at very high (relatively speaking) prices. If below the chassis esthetics are of less importance, leave the cans in place and wire around them using an appropriate value replacement, one typical brand being axial-lead XICONs. Mouser has the best price on these. Also available are "snap-in" type computer caps. No leads on these, of course, just tabs. The third possibility is to remove the offending can capacitor, gut it and re-stuff with one of the new, smaller types. Personally, I below chassis wire in XICONs. But, it all depends on what your pleasure is. de Jeep/K3HVG

Before you go to the trouble of replacing the electrolytics, you really ought to reform them. If they are still moist inside, they will usually reform to like new characteristics... If you don't first ruin them by turning the radio on.

To reform, you need a DC supply at the WV rating of the capacitor, and a 2K 5W series resistor to limit current. If your supply has a roll back current limit pot, you can set that to a few tens of milliamps instead. It usually only takes a half hour to reform a cap. You can tell how you are doing by what happens with the current. The current should drop to near zero.

Digi-Key, Mouser, and when you absolutely need can caps, Antique Electronics
Supply. A phone call to 1-800-DIGI-KEY for a catalogue will be an eye-opener
if you remember what their catalogue was like ten years ago. These days it's
bigger than Newark or Allied.

Hi Dave,

If you don't find what you need surplus, www.jameco.com has better prices on most than www.mouser.com A couple others to compare with would be www.alliedelec.com or www.newark.com .

I often find what I need from some of the places that buy excess inventory from manufacturers but do watch their prices. Sometimes they are more expensive than just ordering new. You can check out www.allelectronics.com www.alltronics.com or www.mpja.com

Good luck on your project!

765. Hardware Question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-02-25 21:55:41 UTC
From: Denis Sharon <denis.sharon@comcast.net>
Message-ID: <39idnWl54pF_mH_YnZ2dnUVZ_sWdnZ2d@comcast.com>
Source record: 8809

Hello,

Can anyone tell me just what means was used to tighten and loosen the serrated/ribbed/knurled thin nuts used on panel-mount toggle switches?

I've been a gearhead since birth and have tinkered with radios almost as long but have never encountered a tool to properly operate these decorative nuts without potential damage. In one type of application, a hex nut is used behind the panel with a decorative serrated nut on the front side. In this case, it is a simple matter to merely tighten the behind-the-panel hex nut. In other applications however - such as my TMC GPR-92 - the is no hex nut and the switch is secured by only the serrated nut thereby requiring a means to tighten it properly.

Replies directly to denis [dot] sharon [at] att.net would be appreciated. Thanks

Regards,

Denis Sharon W1AOK

Sadly, direct replies to posted questions goes against the spirit of
usenet.

The usual way to mount a switch is to align the knurled nut just slightly below
flush with the switch threads, and then tighten the hex nut that is on the back
side of the panel. This, of course, is not always possible. In those cases,
smart manufacturers used a decorative nut that can be engaged with a 12 point
socket.

The RCA Red tubes were 50,000 hour industrial versions.
I remember these being from the late 1950's and 1960's.

Hi,

I have in my possession a Scientific Radio SR-210 FS transceiver that isn't working. Trying to get info on this rig has been a major PITA (pain in the as*)and searching the web has turned up very little information.

Here is some basic info on the rig:

10 channel shortwave transceiver, 3x6146B finals, 2-30 MHz, built-in power supply, Collins filters, LSB/USB/AM/CW/FSK

Does anyone have any other info on this rig? I'm trying to get my hands on an operating manual but have had no luck.

Any and all help appreciated!

John Barnard

I have a knurled nut wrench, which I purchased to remove the knurled nut on my KWM-380. It was a high quality driver. However, no matter how hard I tried, I could not remove the nut. There simply was not enough contact. I finally had to use a pair of pliers and destroyed the knurled nut.

That led me to not want to reassemble the switch using the same technique. I ended up using a nice 12 sided nut. It looks fine, though not original.

So, my KWM-380 is now non-standard. That does not bother me too much since I also have non-standard boards inside.

If its possible to get to the back of the switch you can
try to loosen the back nut, usualy a regular hex nut. I've
also had some success by using a pair of pliers padded with
tape. Also, try a drop of WD-40 around the threads of the
nut. Let it soak in for a few minutes.
Some of these trim nuts are so thin that putting much
pressure on them with pliers will distort them and make them
very difficult to remove.

I did not have any access to the backside to manipulate things.

Had I to do it over again, I would have tried something to try to dissolve the bond between the knurl and the threads. But, it does not take much to round things out enough to make it impossible to take it off gracefully.

Seems like you get one chance to do it right.

There is some info in the r.r.a.b FAQ -
http://www.virhistory.com/ham/rrab.faq.htm

==========
It is a poor job that doesn't require at least one new tool !
(I don't know whether these are still being manufactured or not, but
here are some leads)

Techni-Tool listed 2 adjustable knurled wrenches, 1/2" and 5/8", for
$13.20 ea. The collet in each allows 1/16 adj to allow for finish
thickness. Brand is listed as "Knurl-Tite", stock# 388WR014 for the
1/2" and #388WR016 for the 5/8".
Techni-Tool
5 Apollo Rd, Box368
Plymouth Meeting, PA 19462
Phone 215-825-4990 sales 941-2400 fax 828-5623

Also look for GC electronics GC-9358 (1/2") and GC-9359 (5/8")
A distributor is Jay Tronics @ 815-965-8786 (speak to Joe) and are
priced as follows: The smaller size wrench is GC catalog #9358 for
1/2" nuts @ $15.35 and the larger size is GC catalog #9359 for 5/8"
nuts @ $11.95.

Why risk frying an expensive power transformer by turning on an antique
radio?

If you reform the caps the way I said to, you will know before you finish
if the cap is going to be good for the long haul. I have never had one
fail that correctly went through a reformation.

That said, I have lost electrolytics when I have tried the trick of using
a variac to "reform" the whole power supply before applying full mains
voltage. I am quite sure that most of them would have reformed correctly
if I hadn't skimped on the process.

Why would you remove the cap to reform it?

On tube circuits, you can do the job in place, just don't fire
up the filaments.

The important point to reforming is that you don't supply buckets of
current to the subject capacitor. If you do, the capacitor will create
little localized hot-spots where the oxide is too thin.

When I took the First Class, there were a huge number of people who had basically word-associated the question pool, and who were passing the test with basically no technical knowledge at all. I am told that at some point there was an oral examination as well required of First Class operators.

(The First Class is _not_ an entrance examination, the way the ham radio license tests are... it is... well, it WAS an attempt to make sure commercial radio engineers met a certain standard.)

I do not think a pure multiple-choice test is ever all that effective, in part because it's possible to pass it that way.

This happens on a daily basis in the ARS too, unfortunately.

Multiple choice exams are not a bad thing.

Imagine what your GPA would have been in college if all your professors gave multiple-choice examinations AND gave you the question pool from which the exams would be derived, at the beginning of the semester.

Multiple choice tests are ok, but I understand the point being made. Yes it is possible to do word association - I've done it on exams I was taking with NO WAY to study for. It does help tremendously though - to have a clue about the content. I studied for every test other than that one. I like to give myself the best possible chance to pass. I for one - don't like handing my cash over on a whim. IF I have to pay to take a damned test, I want to make sure I get my monies worth. As a VE team leader for both Amateur Radio and Commercial exams (almost useless) - I've seen lots of people come and go. You can usually tell who knows their stuff or at least are trying.

I had a professor, the late great Dave Simons, who would make EE tests that
were multiple choice, and had partial credit.

He had taught for so long, that he knew virtually all of the mistakes that
the kids would make, and would put the answers that would result from the
different wrong paths as the different choices.

If you have the bandwidth to download a 13-megabyte PDF file, check out this scan of November 1937 Radio World (the link at the bottom, page 19).

I had no idea that Hammarlund sold their Super-Pro receiver in a console cabinet with bass reflex speaker system. I wonder if any of these survive.

The only similar items I've seen are the R-12 console speaker cabinet for the Hallicrafters SX-28 and the Halli dual-diversity receiver with cabinet:

Ugh!

I don't know very much about very much but always thought I knew about SX-25s. I own 3 SX-25s and have owned several other additional SX-25s over the years. This one is inconsistent with any SX-25 I've ever seen. The ANL and BFO knobs are not original. The ANL and BFO should be a toggle switches, not a rotary switch. The cabinet looks to be repainted. It may just be the impurity of digital photography or lighting but the cabinet is "too crackly" and "too creamy grey" in color. The holes to the right of the after-market S-meter indicate some other circuitry invaded this particular SX-25 at some time. Lord only know what you'd find under the hood. My suspicion is that someone tried a refurbish job, got halfway into it and abandoned it. $99 starting bid and $40 to ship? They did a nice job on silkscreening the lettering. But I think I'd let this one pass by.

I just got an ARC 5 receiver and wonder if anyone has any tips on modifying
it; I had one in the 1960's, but can't remember what I had to do to it. I
think I replaced the dynamoter plug with a modern one, but dont remember how
I put the tuning knob on the front.
Also, what voltages are needed?
Thanks in advance for any info.

Rewire the filaments from 24 volt configuration to 12 volts.

You need +250 for plate voltage.

It's been 50+ years since I modified one, so I don't know the pin assignments.

I also remember seeing an ad for it, actually I think a
product announcement, in an ancient magazine called
Communications. I had a collection of these at one time
but I think they were lost in some move.
The Super-Pro has excellent audio quality because of
its symmetrical wide-band IF and good audio amp. A very
expensive RX at the time.

Hi!
The tuning needs a special socket in a splined multi pointed star formation.
The best source is of course the original remote cables, but finding
those would be a minor miracle by now. It just might be possible, if you
have well stocked hardware store near you to find a nearly identical
socket which could be made to fit. Don't forget the output impeadance of
the audio transformer is about 200 ohms to match the original crew
headsets. Actually by now I reckon that you might find that a lot of the
bypass and coupling caps in the cans along either side of the chassis
are leaky and may need replacing.
I'm not sure which RX you have, there are actually about 5 or 6
versions. The Hf ones above 3 MHz or so are very lacking in selectivity
with an IF frequency of 1.4 or 2.6 (I think) MHz.
I still have one of my first homebrew Ham RX's that I made back in the
1960's when I first came out to NZ.
It was a triple superhet, Ist IF tunable from 3.5-4MHz, 2nd IF 2xARC5
IFT's at 1.4MHZ and 3rd IF 2 stages of 85KHz using "Q5er" ARC5
transformers with 6 tuned circuits.
Worked very well but did have some image problems 2.8 MHz away from the

wanted signal.
Hope you can get it all going OK. I sem to remember several ideas published back in the 1960's and 50's which you might be able to trace on the web.
73's
Cliff Wright ZL1BDA ex G3NIA.

In the 50s I used to make the tuning knob shaft with a piece of car
radio antenna that fit and filled it palster of paris and pushed it and
let it harden. It's removeable but I'll bet there are some better
synthetics available today. I see the splines selling for $5 top $10 on
ePay.

It is perhaps more accurate to refer to the R-1051 series of receivers
as decade-tuned than as digitally-tuned: each digit in the frequency
has its own knob.

For a tuning knob you can use an old tv or radio knob, the type that
fit on the shaft that was split and had splines on it. Most of those
old knobw will fit on the arc 5.

Another way to do it is to remove the shell that is around the tuning
shaft. That will allow you to put a 1/4 inch shaft coupling on the arc
5 shaft. Then put a short shaft and knob on the other end and you are
all set.

I suspect they were special order. The Super-Pro itself
was the most expensive general coverage radio on the market
during its lifetime. Add to that the cost of a custom
cabinet and good quality loudspeaker and you have something
not many could afford. I would guess the combination at
around $600 to $800 U.S. While one can't get exact
translation of money values from the past somewhere between
10x to 20x is probably about right. Remember that in the
1930's and early 1940's a new car could be bought for around
$500.

I am assisting a neighbor with an estate sale. The
estate includes two Hammarlund radios. One is a Model
SP 600, the other is an HQ 170A. I don't know the
condition of the radios. There are also approximately
2,100 radio tubes still in the box. The owner passed
away a couple of weeks ago. He was in the radio/TV
business for years. He was 91 years old.
He also has two oscilloscopes, various testing meter
equipment.
Please let me know if you are interested and I will
send a link to photos of the radios.

Mike,

I suggest you do these things first:

1. Do a search on closed auctions in Ebay, and get an
average price for the radios before you consider any
offers. Be sure to check if the HQ-170A has the
"VHF" converter(s) in it, since they add a lot
to the value.
2. Have a local ham or TV repair shop check the units out:
you'll get a lot more for them if they've been serviced
and are guaranteed to be working.
3. Since TV repairmen often put old tubes in new boxes,
separate the "New Old Stock" tubes from the pulls.
4. Make a list of the new vs. the pulled tubes, and ask
around to find if any are extraordinarily valuable. If
not, it'll be easier to sell them as a lot instead of
one-by-one.
5. Consult a tax adviser to find out if the estate would
benefit more by donating some or all of the equipment
to a local ham club or school radio club.

I hope this helps.

Bill, W1AC

For those who want to create djvu files as well as read them, you can
download the free DjVu Solo 3.1 software from
http://www.planetdjvu.com/resources.htm

I think this is an obsolete version of the current DjVu software.
Resulting files are often far smaller than corresponding pdfs,
especially for such items as circuit diagrams.

There are also web sites that offer a free conversion from pdf to djvu
and also provide an index to the text - even for photocopied boatanchor
manuals. One example is
http://any2djvu.djvuzone.org/index.html?title=Any2DjVu+Server

Hi

I managed to pick up an almost new ARC5 receiver a year ago and later found a dynamotor. The set worked well for a bit then popped a smoothing cap. My suggestion is to run on much lower HT (I have heard that these sets might even work on 28v HT). I don't like modifying classic antique sets such as these that are now getting harder to find - it immediately reduces the value by over half apart from anything else, especially if the front is altered as many were.

Tuning knobs can be found on internet auction sites, but even a short piece of thin stiff plastic tubing slipped over the splines with some solid rod inserted the other end and a knob will work.

There were many conversion articles/books written in the 1950s which sometimes turn up at radio sales or auctions but these usually show major mods to create a cheap and useful piece of ham radio gear. But times have changed.

Roger. I started a thread earlier on using 813's as triodes and it was like falling off a log. The modulator consists of a very small chassis with a fil trans, tube sockets and a meter. This sits next to the mod iron on a wood deck. I like the idea of the mod iron isolated from ground.

> Such a project is never really "finished", because there are
> always new ideas and parts to be tried out.

Roger again. I want to eliminate the Ranger for one thing starting with the audio. I bought a 4W audio pre-amp and when I get tired of playing with the new rig I want to see if this will drive the 813's. I need some ideas on interfacing the two... some sort of interstage audio transformer I suppose.

Then, a simple xtal controlled exciter would be fun.

No end is there?

Hi Ted,

I wanted to contact you about your Redifon GA481 amplifier but i could
not find your mail address so i am responding to this notice. I
recently bought a GA481 that i want to use with my Redifon GK203 Exiter
(same as you have?) but i don't know the pin-out of the control
connector. Can you help me with this? Also, i have the green version
(GA481C) and the input is labeled "0.5 Watt", i would have expected 0.1
as the exiter output is only 0.1, what is on your label?
If you are interested, i restored a German Radio Truck filled with all
kinds of stuff, i have put some pictures on www.pa1wan.ne

Kind Regards,

Willem Noorloos

FWIW, the SP-600 is the JX-17 version, as it should say
on the label on top of the tuning unit. Its had what is
called the IF gain modification but the card holder, located
between the dials, has fallen off or been removed (its glued
on). The red knobs are exclusive to this model.
If you are lucky it will have a top and bottom cover,
they are often missing.

830. Capacitors, tubes, radio parts, Solid state rectifiers for sale

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-03-01 13:46:08 UTC
From: Dave Watts <watts-d@rmc.ca>
Message-ID: <45e6d84c$1@win9.rmc.ca>
Source record: 8773

I have a large assortment of NOS capacitors for sale. These range from Black Beauties by Sprague to Pyramid, Aerovox, Sangamo, etc. Let me know what you need and I will see if I have any. I test all of these on capacitance meter before selling them and guarantee them.

I have a number of Sprague doorknob capacitors that are NOS. Again, all have been tested for capacitance. These are 500pf 20kVolt caps and I would like $10 each for these.

I have a Hammarlund MC-325-M variable capacitor that is new in the box. $30

I have a large number of tubes that are NOS and NIB that I am slowly selling. If you need anything, please send me a list and I will tell you what I have. I do have some 866A and similiar to that.

I have 4 new 1N2637 solid state rectifiers that replace 3B28,249B and 866 tubes. These are Sarkes Tarzian S5130 and test great on my tube tester. $25 each

I have the following old repair parts for sale as a lot or each. These are all NOS and NIB as far as I can tell. Let me know what you are interested in and make an offer.

General Radio Parts* 846AK Variable Caps 2-11uuf , 846BK 2.5-20uuf , 119-A Choke .25H , 301 Potentiometer 200 Ohms

UTC Parts Variable Inductors VIC 7 .13 H , VIC 14 3.4H , VIC 18 21H , VIC 21 83H
Peterson Radio Crystals Z-1 Type 5000 , 2500 , 1000 , 500

Hammond Choke 1506 1.6mH

Meissner Parts 19-6842 RF Choke 30 mH , 19-4551 RF Choke 5.5 mH , 19-6846 RF Choke 80 mH , 16-6668 LF Input , 16-6658 Input IF 454Kc

Miller Parts 4525 High V RF Transformer , 6203 4.5Mc IF Input and Interstage , 6204 4.5Mc IF Discriminator , 6205 4.5Mc IF Ratio Detector

5480-C 455Kc Oscillator , 6320 .2-3 mH tapped , 6196-TV Hor Width Cont 55 Sweep , 6195-TV Hor Lin Cont 55 Sweep

With all of these items, buyer pays shipping of course. Thanks for looking!

Dave

> 2. Have a local ham or TV repair shop check the units out:

Or simply sell them as-is and let the buyer do the restoration. Most shoppers at the typical estate sale are not hams or "radio people" and may not even recognize what these things are. Unless you find a way to publicize your sale to some kind of radio community, you might not find anyone interested in buying, period. Whether the radio works or not would be immaterial to a shopper looking for glassware or collectible toys. And a serious radio buyer would understand that every radio of that vintage needs some routine service before being played regularly.

For what it's worth, I sold a very nice Hammarlund HQ-170C a couple of years ago for around $200. Again, it's a pretty narrow-interest receiver. Ham bands only -- no shortwave, no standard broadcast band, so it wouldn't interest the general public unless you find a dealer who plans to resell it on eBay.

> Consult a tax adviser to find out if the estate would
> benefit more by donating some or all of the equipment
> to a local ham club or school radio club.

Or radio collector club. Check the list at http://www.antiqueradio.com/clublist.html to see if there's a club anywhere in your vicinity.

To get a tax benefit from donation, you need to be able to verify the fair market price of each item, and also make sure that the organization qualifies for tax-deductible donations (the organization should be able to tell you).

You could also ask the club to notify their members that the sale is coming up.

Regarding the tubes, if you can connect with a nearby club, maybe someone there could stop by and eyeball the collection, to give you some rough clue what they're worth. A lot of the tubes used in 1950s/1960s receivers are still very common and not worth a heck of a lot, even if new. And as noted earlier, radio servicemen were notorious for sticking dead or half-dead tubes into the boxes after installing a new tube. So unless you have a sealed box that obviously was never opened, you have to either assume the tube is used, or go through the process of testing it.

There are earlier tube types, such as 45 or 1L6, that are worth more, but of course they are scarcer. Most TV tubes are still available new in vast quantities and worth almost nothing. But there are a few exceptions. If you have a type 15GP22 color TV picture tube, I'd be interested in that, for example, but they were scarce when new and few if any exist at this time,

outside of the original TVs that they came in.

Some suppliers, such as Antique Electronic Supply, http://www.tubesandmore.com/ , do buy old stocks of tubes for resale. You could get some idea of what yours are worth by looking at their website. Of course, they would offer you a wholesale price rather than the retail price shown on their site.

Regards,

Phil Nelson

838. analyzing and tuning bandpass filters

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-03-02 00:52:15 UTC
From: dansawyeror <dansawyeror@comcast.net>
Message-ID: <BLSdnbZO1-zc6HrYnZ2dnUVZ_gydnZ2d@comcast.com>
Source record: 8782

All,

I have a couple of Heathkit 5400s, they have common bandpass filters for rx and tx. I have an HP 8407 network analyzer I am using to 'tune' the filters. It is pretty straight forward to insert the signal at the rf input and pick it off after the filters. Everything about the instrumentation is working as expected.

What is not is the characteristics of the filters is all over them map. The design is common, they are a 3 pole design, with an LC parallel pair to ground, coupled with a C to the next stage. There are 3 LC pairs and 2 coupling caps. Each of the L's is adjustable. The C's are fixed.

First question: On one radio the 10 meter band tunes best at about 24 MHz. By 28 MHz it is down over 10 db. On the other it tunes well. (on the second radio the band is nearly perfect.)

Second question: On each radio there is at least on band that tunes very wide, 3 Meg or so. The shape is a node with shoulder peaks on both sides about 1 Meg above and 1 Meg below the band.

What would be the best way to debug this?

Is there a good filter modeling tool for this filter design?

Thanks - Dan

Hi Gang:

This is an old reduction tuning knob with a vernier dial made by
National Radio. The action is smooth. Perfect for antenna tuners or
amplifier tuning.

I'd like to get $12.00 for it plus postage. Any takers?

If interested please reply by e-mail.

73,

Michael,

W1RC*at*verizon*dot*net

842. Duty factor for Drake L-4B

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-03-02 14:00:50 UTC
From: "John, N9JG" <john@Xremove.MeYgotwals.com>
Message-ID: <m6WFh.5999$G23.1650@newsreading01.news.tds.net>
Source record: 8786

I have a Drake L-4B, which I purchased new in about 1975. Recently I have started to use RTTY mode with the L-4B, and I have some concerns about what is the safe RTTY power level for this amplifier. The Drake easily puts out 1 kW into my antenna, but during an RTTY contest the transmission duty cycle can approach 50%. During a long-winded rag chew, a transmission might be as long as five minutes (just like the old AM days!). I am reasonably certain that the L-4B (both the amplifier deck and the PS) can withstand long transmissions at (say) 500 watts out, but my concern is with the 1000 watt level.

John,
The tubes are rated at a total of 1000 watts dissipation, so I'd say if your input is 2kw and output is 1 kw you are ok.
The power supply might get a bit warm but I seriously doubt that it would fail under these conditions. I hear that the electrolytics fail often in L4Bs at about that age, so the heat in the PS might not be good for aging caps, so now might be a good time to change them.
If you are ragchewing you could back the power down or maybe use the low voltage setting, but for contesting you probably want all the power and dbs you can get.
By the way, I have one here also and I need to get in there and change my caps too. I recently added a transistor swiching circuit for the antenna relay to make my transceiver happier.

Why push it ?

The difference between 500 and a 1000 watts is only 3db

Its not worth stressing out the power supply and tubes.

Thanks for the reply. Your suggestion about the HV caps has already been followed. The L-4B was in storage from 1990-2005, so before I put it back in service, I replaced the original Eimac finals with Chinese graphite anode 3-500ZGs and replaced the HV diode and cap strings. Like you, I didn't want to have an aging cap blow.

I followed the recommendation in my Orion manual and use an Amitron ARB-704 switching box to interface between the amp key output of my Orion transceiver and the VOX relay input of the L-4B.

Interesting. It's hard to tell from those little photos -- is the front
panel made of wood, or metal painted with a wood grain?

I assumed the front panel was plain metal, from looking at the photo in the
magazine article. But that, too, is not very clear.

I bought this thinking it would fit my SX-28, but it doesn't. It's the one
with the white dial pictured on the right:

http://antiqueradio.org/art/temp/Hallimeters.jpg

I was told that it belongs with the R-45/ARR-7 military aircraft receiver.

If you have any use for it, make me an offer. I had thought I would use it
to make an external S-meter for my S-20R (or whatever), but there are just
too many unfinished projects around here.

To contact me, kindly go to http://antiqueradio.org/contact.htm .

They are not easy to find. I eventually found one on eBay after searching for a long time.

I have been told that the meter from an SX-25 will fit.

That particular picture was of the faux wood grained metal front
panel. There were some with the regular black silk screened panel.
According to records, only 80-90 were produced with the wood grained
front panel.

FWIW, Although the Drake manual for the L4B says that tuning/operation
for CW and RTTY are the same, in one of my L4B books, there's what looks
to be a 2nd or 3rd generation copy of a Drake letter that speaks to RTTY
activity. The Drake letter recommends that the power level for RTTY be
limited to 400 watts, citing the near 100% duty cycle, when key-down. I
guess you take your pick? I run mine at about 400 watts, just to be on
the conservative side.......

Before I read Jeep's response, I was getting ready to respond that 400 watts of output is right. Solder melts and things fail. I think that is a realistic number.

It is not the tube plate dissipation that is the limiting factor. It is heat - both from the components and from the currents flowing through the switch contacts and the coils.

Does the L4B use the Eimac tube chimney and matching tube socket?

The tube pins can get so hot the soldered connections on tubes without the chimney/socket [i.e. Heathkit Cooling] can and do melt at 100% duty cycle at full power.

Came across a couple of those RF antenna current meters. Typical they have a scale up to three of five amps. One is US and other is UK war surplus.
AIUI the meter movement is driven by a small DC current produced from the output of the thermocouple.
The thermocouple being heated by the RF current. Looks like the meter itself is a one or five milliamp movement. Can anyone comment/advise?
Thanks.

Well, they could be either a self-contained meter; one that one hooks up directly, inline/series, with the RF current and the other is as you have described. If the meters are not of the sealed type, you can remove the movement from the shell and have a look. Try and see if there's a thermocouple mounted somewhere as an integral part of the unit. Meters, like on the TCS, BC-191/375, and the ART-13 for example, are self-contained. They generally all work the same, its just where the thermocouple is located. That's my observation on the subject.....

The May 1969 issue of Popular Electronics has plans to make a 5 Amp. AC Ammeter out of a BC-442 meter. It uses 300 ohm twin lead as a 0.1375 ohm shunt. They show 31" plus 1/2" for connections at each end. I have the proper meter but never acquired the thermocouple.

Richard. If your ARC-5 is original my strong suggestion is to not modify the radio itself, except to fit some kind of tuning knob to where the tuning cable was originally attached. You don't mention what frequencies yours tunes. The most valuable model covers the broadcast band. In mint (unchopped) condition some of those have sold recently for over $100! And value is rising. Other frequency, unmodified ARC-5 often command $50 or higher.

It is not necessary to modify the receiver itself. I had one at around age 14 which operated with an outboard power supply etc. the ARC-5 being completely untouched. It was my first superhet radio.

Information is readily available from other enthusiasts and on the web about connections. I could forward some info if you wish.

Many of the 'chop jobs' done when these receivers were commonly available (And cheap, sometimes as little as four dollars etc.) were a shame and substantially reduced their value without improving the ability of the receiver to work just as well as it did when installed in an aircraft.

As you mentioned there is a 3 pin dynamotor plug on the back. You can either connect wires to that to power the radio or power it via the socket at the back. I have found that certain sizes of those blue shelled crimped 'wire splicers/joiners ' commonly used to join say car wiring will slip nicely and fit over those pins without destroying them (some types will; some won't so experiment a bit) I do hope somebody has not soldered to yours. It ruins them!

The sockets and plugs on those radios are a beautiful job of metal pins mounted in mica. Some people have chopped them out and installed various other types such as an octal etc. Some people have been able to find an ex dynamotor base, or have made, a suitable base plate on to which they have a mounted a small power supply; not very hard to do. The advice about running the radios at much lower than the

original 250 volts DC B+ that the dynamotor put out seems to be very good indeed. because the metal cased capacitors inside the base now 60+ years old can deteriorate, sometimes leak and/or short circuit. have a fuse in the power supply no matter how you power it. Once or twice power supplies specifically for that purpose have been seen on eBay.

The 12 volt tubes are wired in three pairs so as to work on the 24 to 28 volt DC aircraft supply, so that heater current requirement is 3 x 0.15 = 0.45 amps at 24 volts. The 28 volts also powered the dynamotor on the back of each ARC-5 receiver. Radio Shack used to sell small 115 volt input transformers that put out 24 volts at more than sufficient amperage However many enthusiasts have transformer lying around that may be suitable for the heater circuit and to provide B+. If you do 'have' to modify the heater circuit to 12 volts it will require about 0.9 amps. AC for the heaters is fine.

Even if done neatly other modifications to the front of the radio to add a) RF gain control b) CW BFO on/off switch and sometimes also a phone jack, usually involved butchering the plug in unit that goes in the front secured by four small screws. It usually wasn't possible to fit the controls into the small box that comes out so it and the screened area behind it was often chopped out.

Some are lucky to have a one, two, or three position slide in plug in rack into which these radios were mounted in the aircraft. They are not very common now so it is usually necessary to connect wires in some manner to the connector socket on the back of the receiver itself. Best, if possible, to use some sort of small plugs to avoid damaging the socket.

Somebody mentioned the gauge of wire that will just neatly plug into each socket; maybe it was #6 or #8 AWG, I'll try and measure which size fits firmly and tidily. And advise here.

>From memory to get the radio to work it is necessary to provide power. An RF gain potentiometer (no AF volume control was provided) and provide a switch to ground (IIRC) the BFO oscillator lead. Another caution is check whether the output transformer, which fed aircraft headphones directly or the aircraft intercom system, could be set, on most models for either low (600 ohm?) or (6000 impedance?) required soldering inside IIRC. Volume output may seem low if set to high impedance.

As mentioned a lot of this is from memory; I have six of those radios downstairs but haven't worked on them since the 1950s! Three of mine have been 'got at' and three are almost pristine but are all the same frequency coverage.

There are most likley many people around who will have better information; but am rushing this reply in order to encourage and urge you from unnecessarily 'butchering' yet another 'Command' receiver as

so many were in the past.

As advised it is completely possible and was quite common to have a power supply and all controls neatly outboard and to not have to chop up the ARC-5 radio at all. One advantage being that if one then acquired another ARC-5 it was not necessary to also modify it! Just plug into the same power supply etc. and head phones, attach the antenna and away you go.

Another seemingly unnecessary mod. that has been seen is that which replaces the output circuit to provide enough power to feed a speaker. The out put tube is a 12A6 which could provide sufficient audio output. But attempts to do so often burnt out the primary winding of the original 'potted' output transformer in the plate circuit of the 12A6 tube. That led to replacement, inboard and outboard OP transformers and sometimes the displacement of of other parts. In one case someone added another tube on the back of the set in a most untidy fashion!

If I can provide additional info which I have somewhere please contact me. Again I urge, do not make unnecessary alterations.
Terry.

What type is the thermocouple? If it's a Type J or K, I probably have
some junk box stuff.

But this is revisionist history.

Nobody has an obligation to keep things intact for some potential
point down the road.

Those things were cheap and plentiful back then. Even in 1972, I could
get a Command Set transmitter for ten dollars, which meant that modifying
it to be a VFO was a far better choice than buying parts and making a VFO.
If you got it for ten dollars, who cares about resale value? Especially
when you could turn around and get another. If they'd carried a higher
price back then, obviously people would have thought twice about it,
because their appeal would be less. But they were so plentiful that they
were practically given away, so it was perfectly fine to do whatever you
wanted to do with them, even if it meant stripping it down and basically
using the chassis and variable capacitor(s) for something drastically
different, like a homebrew receiver or SSB transmitter.

Obviously it's all a different matter, now that they have become scarce.
But it's now over sixty years after WWII ended. And of course, if people
hadn't been making use of them, doing whatever they wanted to do with
them, then the numbers wouldn't have dropped, and while some might consider
them valuable, nobody could get high money for them, because they'd still
be plentiful.

But it's silly today to be critical of what was done to them back then
because things are meant to be used. We bought comic books and read them
and wore them out and threw them out; we didn't keep them in plastic and
never read them. We bought equipment and put it to use, and if things
weren't to our liking, modified them, and if things broke down, they
got fixed and nobody felt a need to keep things exact. And people got
value out of all that surplus equipment that came out of WWII, precisely
because it was cheap and in large quantities. Because things are made
to be used.

You can easily determine if the meter is a remote reading meter or one with a built in thermocouple. Put a digital ohmmeter on the meter leads. if the resistance is very low, then the thermocuple is built in. If the resistance reads tens of ohms or more, it is a simple dc meter that can be used for any purpose.

I have found that many of the remote reading meters are not calibrated in actual amps, but are relative reading.

Often the rf ammeters that are self contained contain a bakelite or formica back to give clearance to the rf.

I fail to see what good this is. You have to upload the big file to
convert it on line. Might as well just send the big file to the
recipient and be done with it.

The British ones (black bakelite cases) almost always have the thermocouple
built into the meter. They will usually be marked "Thermocouple" or "For
Radio Frequency Only" on the dial, and the resistance is usually shown
as well.

Be careful: the thermocouple is *VERY* delicate and will not stand up
to overload - the nichrome wire melts and it's useless thereafter.
(I've blown up an ex-Admiralty plug-in meter that was scaled 0-500mA
but had "requires x20 shunt" pencilled very faintly on the back.)

Chris.

Measure the post with calipers, then look in the Concord catalogue for
the wire wrap post type of that size.

The Radio Shack one is intended for IC sockets.

>Yes it does. Drake did an excellent job when they designed and manufactured
>the L-4B.

Well, I'll say this- it sure is a pretty amp, with that lovely blue glow from those meters and that warm glow from those beautiful filaments.
Mine was cranking my signal out in fine style the first 24 hours of the dx contest, getting me easily across the pond to all over Europe from NJ on 80 meters and making me quite proud.
I wasn't even transmitting when all of a sudden..... ka-pow ! a flash of light from the power supply, and I dove for the power switch, and unplugged the line. Then the smell of burning something or other.

So far here's what I've determined, then we can debate how excellent it was designed. There are 2 bleeder resistors up on top of the PS on either side of the transformer. They are 50k at I guess about 50 watts, and if so, are within spec even at 3000 volts. One of them opened up for some reason, and I can't think of a eason for a bleeder to fail other than it just got to be too old. Now, 120 volts is derived from the bottom of the bleeders through another power resistor of about 5 k, I forget exactly. This positive 120 volts is used for the antenna relay and in standby is applied to the CT of the filament transformer to cut off the tubes in standby mode. So when the bleeder opened, the HV probably went up a little, and the tubes drew some extra current, I don't know how much, or how long but eventually it blew a little 0.82 ohm fuse resistor in the HV lead.

Still TBD is how much damage was done to the tubes due to the loss of bias. I really don't like the way they get bias and will consider putting in a little 100 volt transformer in the RF section to derive my own bias. In fact it could even be redundant, fed in parallel with the original through a diode.

Now I am searching for a replacement bleeder, has to be the exact size as the original because there isn't any extra room in the PS. Gee I'd like to put in a bigger bleeder, because bleeders should not fail. Wonder if Drake considered this senario when the L4 was designed. Maybe so, maybe they figured no serious damage could come to the tubes and eventually the PS failed safe and stopped before the house caught on fire, because this could have happened when I wasn't in the shack.

>
> Phil
>
There were cars available for not more than about $800.
It was a lot of money.
1945 catalogue prices for the Super-Pro give prices of
$425 for the rack mounting receivers, $15 for a table
cabinet, and $20 for a 10" loudspeaker in cabinet. The
deluxe wood floor cabinet is not mentioned but this is not a
complete catalogue. There is a deluxe version of the HRO in
a table size rack with a combination power supply and coil
holder for $475. The most expensive receiver is the
Hallicrafters S-37, which covered 130 to 210 mhz, $591.75
plus $15 for a speaker in cabinet. For comparison the SX-28A
Super Skyrider in a table cabinet was $223 plus $15 for a
speaker in a cabinet.
There is a relative purchasing power calculator
at:http://www.measuringworth.com/calculators/ppowerus/index.php
According to this $550 in 1945 is equivalent to about
$6200 in 2006 money. For 1939 the value is nearly $8000.
Remember that many working people made less than $5000 a
year during this time. For car prices see:
http://www.thepeoplehistory.com/40scars.html
The average was around $1000 but cars were available for
well under this.
Probably discounts applied to both car and radio prices
but, nonetheless, the top of the line receivers were _very_
expensive items.
Some clue to wages can be found at the same site at:
http://www.thepeoplehistory.com/1940s.html
Average wage for 1940 is given as around $1725.00

From the photo these were specials without the crystal
filter or BFO, strictly for high fidelity broadcast
reception. A similar model was available in rack mount for
broadcast station monitoring. I am not sure about the SP-200
and later series but the first Super-Pros (SP-100) could be
bought without the crystal filter at a lower price.

Get rid of those big bleeders. Disconnect the 120 volt bias line from
the relay and put a 50k to 100k (1 or 2 watt is fine) resistor between
the center tap and B-. Use the relay contacts to short out the
resistor on transmit. The tubes will self bias themselves to cut off
the resistor will keep the cathodes from floating up too high when the
relay opens.

You will also loose the alc holdoff voltage but no need for alc
anyway.

Several comments about the bleeder resistor failure. Other than the finals, those two bleeder resistors "bleed off" more heat than any other component. My L-4B is about thirty years old, and I am guessing that the design engineers probably used 20 years as a useful design life. You and I should be happy that the resistors have lasted for 30 years. I am sure that the life of these resistors are affected in large part by how often they are cycled from room temperature to the operating temperature of perhaps 130 ± 20°C. Was the power to your L-4B cycled on a hourly basis, or was your amplifier powered on for the entire day?

If you cannot find suitable resistors, perhaps you could replace them with resistors of a larger ohmic value, and then bias the finals so that their resting current is about the same as the value drawn by the original bleeder resistors.

My last comment is in the form of a request. When and if you find replacement resistors that are physically and electrically suitable, please let me know the source so that I can buy two as spares.

Thanks Chris and others. Part of what I was wondering is a seemingly
'dud' RF ammeter. The movement might be OK and could be, say, 1 or 5
milliamp etc. fsd.

884. S38 Parts

If anyone has a junker S38, I need the antenna coil.

In one of my senior moments, I pumped 200W into the antenna terminals.

Somebody recently said they might have a suitable thermocouple in their junk box and asked which type the meter used. The article, in the May 1969 issue of Popular Electronics, doesn't say.

Here's the article:

Ah, right. In that case:

The ex-RAF meters (marked A (crown) M for Air Ministry) have the resistance
wire soldered directly to the back of the terminals on the case. The
thermocouple is then spotwelded to the middle of the resistance wire,
and one lead goes to one side of the movement directly, the other goes
via a "coil spring" of nichrome resistance wire (length cut to get the
thermocouple calibration correct) to the other side of the movement.

If it's open circuit across the terminals, then the resistance element
has blown. The thermocouple and movement should still be perfectly OK.

(I've considered trying to replace the resistance wire but calibrating
it will be the difficult part.)

Somewhere I have a box of dead meters....

I may be some time.

Chris.

The Taylor's are cheap, or relatively inexpensive and I've had good
results with them. For the price the RFP don't look bad. I'd give em
a try even though I know nothing about them.

Back in the old marine electronics days we had those 410 to 512 Kcs MF transmitters. They were all required to have built in RF Ammeters. The transmitters had to meet minimum SOLAS radiation requirements by multiplying the RF current by the antenna height above the deepest water line. Usually they were 15 amps or 5 amps fsd (15 for the main tx and 5 for the emergency tx). These meters were pretty accurate on mf but some of the transmitters used them on hf also. On hf they were only accurate depending on the length of antenna/frequency, where the current node is. We are talking a single wire type feeder. At mf the current is pretty much the same anywhere on the antenna due to the long wavelength. I still see some of these meters being sold at hamfests. Virtually every RF Ammeter used had a built-in shunt. Randy,

Hi Folks,

I was trying to dig up info on the Lafayette HA - 350 Receiver - I got some - but when I went to the Bama site, it came back as inaccessible.

Does anyone have said info they can provide? I could use at the least - a block diagram, schematic, parts list, and a view of the insides and back panel.

IF you can do so, please post it and let me know or I can make provisions for it to be e-mailed.

Thanks

The BAMA site and IE7 don't like the HA350 file. I don't know why!

I just downloaded it in Netscape 7.1. It is a 1Mbyte pdf file.

Send me your email address and I'll mail it to you.

When I was a kid there were thermocouple ammeters ex T1154 etc on the
surplus market, usually at about 25% of the price of a normal surplus
meter. So, snip out the thermocouple and get a cheap voltmeter. Not
so, the meter relied on the low Z of the thermocouple for damping.
10 to 20 seconds of oscillation before a stable reading if used as a
voltmeter, about passable if used with a 20A shunt.

Here is an article that you can read.
http://k9sth.com/uploads/Faux_Heathkit_Paints.doc

Most paint stores or auto paint shops have computer color matching -- that
is quite good. Some of the larger stores can even load this paint into
spray cans (the eBay seller mentioned just provides this as a service --
already done).

No, but the manual for the command set may. Or you might be able to figure
it out by looking at the color of the metal used.

OOOPPPSSS ... Top posted. SRI.

I misread the message. I thought the QRZ address bounced.

But, a 'Test' to K8BR@comcast.net has not bounced here.

George, I may have answered the same question on another venue (post
from you?) but I believe the 5100S was a late 5100, factory wired to
accept the 51SB sideband adaptor. That's my recollection.

George wrote:

Thanks for the response.

I saw a post on QRZ.com concerning a 5100S and was trying to find some
info on it. I seem to remember that there was a direct conncetion to
the 5100B for the B&W SSB adapter. This was 34 years ago and my memory
might be a bit fuzzy. If the 5100B did not come with
a direct plug in for the SSB adapter It might have been a mod that was
put in before I got the pair.
I do not remember doing any wiring to couple the ssb adapter.

Your theory sounds reasonable.

911. Hammarlund HQ-180 going prices

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-03-07 22:26:40 UTC
From: Rick <Nospam@reply.in.gp>
Message-ID: <pan.2007.03.07.22.26.39.358740@reply.in.gp>
Source record: 8655

What are the average asking prices these days for a Hammarlund HQ-180 in EXCELLENT condition?

I'm looking for the 180, 180A, 180C, or 180AC, but would consider any of them except the "X" models (the ones that had the crystal switch)... no particular reason except that I have absolutely no need for the crystal switch and would rather have the clock (although I assume I could remove the former and install the latter if I had to...).

912. Differences between Hammarlund HQ-180 and -180A

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-03-07 22:34:48 UTC
From: Rick <Nospam@reply.in.gp>
Message-ID: <pan.2007.03.07.22.34.44.41561@reply.in.gp>
Source record: 8656

On dxing.com, the differences between the Hammarlund HQ-180 and -180A are listed as "solid state power supply, 230 VAC, 3 position BFO, accessory socket, less drift and 500 ohm line output".

How many of these are of any particular importance?

For example, what does the "3 position BFO" do for me that a plain (I assume "single position") BFO would not do?

What is the accessory socket for?

Is "less drift" a dramatic difference, i.e. does the vanilla 180 suffer from stability problems that the -180A fixed?

How much extra would you pay for a -180A over a -180 if both were in excellent condition?

914. tuning passband filters

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-03-07 23:40:57 UTC
From: dansawyeror <dansawyeror@comcast.net>
Message-ID: <UqGdnR-QNLgQ0HLYnZ2dnUVZ_hCdnZ2d@comcast.com>
Source record: 8658

All,

This is a solicitation for advice in tuning passband filters. The instance at hand is a Heathkit 5400. It uses the same RF filter deck for Rx and Tx. I thought I was aligning it correctly by using a network analyzer on the Rx input, sweeping over the band, and taking of the signal on far side of the filters. This seemed to work - even with a builtin pre-amp between the Rx input and the RF-filter deck.

However when I then tried to transmit - nothing. Only one band worked even a little bit. I then read the instructions - remove the output drive from the RF filter deck to the output finals and tune the filters on transmit. The re-tuning was dramatic.

First observation - the filters are not symmetrical. They tune differently on Tx then Rx.

My question: How can the network analyzer be used to tune this rig?

Thanks - Dan

915. Re: Differences between Hammarlund HQ-180 and -180A

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-03-07 23:53:56 UTC
From: Ed Engelken <EdEngel@gvtc.com>
Message-ID: <1173311636.279222.282750@s48g2000cws.googlegroups.com>
Source record: 8659

The HQ-180 has a two-position BFO switch labeled AM (off) and CW/SSB (on). When the BFO is "on" the beat frequency is adjustable using the "BFO KCS" knob. When using the BFO to receive SSB it in necessary to set the BFO KCS switch to 0 (zero) for the sideband selector switch to operate correctly (the BFO must be tuned to the IF frequency). The HQ-180A added a "fixed frequency" position to the BFO switch that cut the BFO KCS switch out of the circuit and puts the BFO frequency at the proper value for SSB reception. Hammarlund did this because people wouldn't read the instruction book and learn how to operate the receiver. Apparently they got complaints about the sideband selection not working when the problem was the BFO was not adjusted properly. The extra BFO switch position was added to make the HQ-180A idiot proof. If you can read and understand the manual, you don't need the extra switch position.

The accessory socket could be used to power up a 2/6 meter converter or similar accessory. Probably of limited use for most folks.

In principle, the solid-state power supply should provide a little better regulation. My HQ-180 is as stable as any other tube-type receiver I own (about 35 or so), so I don't think stability of the 180 is a big issue.

I suppose if I had a choice I would pay $50 or so more for a 180A. There seem to be many more 180 receivers out there than the 180A versions. --Ed

Source record: 8660

I'll add that the HQ-180A has an extra filament transformer to keep the
LO and mixer hot so there's minimal warm up, stability wise. If you
need rapid stability, this might be a plus. If not, its a power drain......

Price wise? It ALL depends on condition. An absolutely mint 180A might
go for $600. I've seen dogs go for well under $200 at hamfests. Same
goes for 170A's, although their top prices won't match the 180A.

Thanks, Dave. I saw that, but didn't know how recent that was (couldn't find a date on the web page and for all I knew it could be as much as eight years old according to the copyright notice) or how real-world accurate it was, so I thought I'd ask here.

I am in the process of doing mods on my Ranger 1. I have studied
everything that I can find online from WA1HLR, WA1HZK, W3AM, AD5X,
W8JI (All have excellent info). All of them with the exception of W8JI
seem to have some version of the WA1HLR mods. I am in the process of
changing all the electrolytic and paper caps. Also increasing the
voltage ratings. Solid stating the power supplies, adding the keying
relays. I am regulating the LV PS with the 2 0D3/VR-150 gas tubes as
in the WA1HZK mods. I am doing the minimum modulator mods, removing
one cap and increasing the value of another. (I realize there are many
opinions about all this)
One item I am not 100% clear on at this time (I may have more later)
is the screen voltage for the modulator tubes. After I remove the 50
Watt adjustable resistor, do I connect the modulator screens direct to
the +300 VDC LV supply? The modulator idle current is then adjusted
with the new bias supply? If I regulate the LV supply at 300 v, will
this be enough for the screens? Has anyone made a complete Ranger
schematic showing all the mods? Any info on this will be most
appreciated. Randy, WB5KCM

924. RCA WV-77E VTVM RF Probe question

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-03-08 22:32:29 UTC
From: Smokey <telegrapher@hotmail.com>
Message-ID: <12v13qkfpbh5vba@corp.supernews.com>
Source record: 8668

Does anyone have a schematic for the RF probe (RCA WG-351A) for the Model WV-77E Voltohmyst VTVM?

BAMA did not turn any up for me.

Apparently the probe uses some sort of exotic rectifier and RC network above and beyond the usual 1N34 diode with small value ceramic capacitor and a high value resistor that you can get away with on many VTVMs.

Obviously if you've got an RF probe for a WV-77E that you are interested in selling, let me know...I am interested.

Thanks!

I'd bet on shorted caps.
If you keep running it like this you'll
soon have a burnt up power transformer too.
New caps will be a heck of a lot easier to find
than a replacement power transformer.

Good possibility Ron. Not only that but these old rigs were designed to run on lower line voltage and with the higher mains voltage we see today only pushes these old rigs harder. Beefing up the components in the power supply wouldn't hurt but because the old iron in these was designed for the lower voltage, it doesn't hurt to run our old rigs on a variac or power supply set up 110v etc..

That was then. This is now. Comments were written in the vein of
vintage radio preservation ; and what are 'Boat Anchors' and any
interest in them, but vintage items? There are probably not that many
'unchopped' Command units around now.
If you want modern go buy an Ipod, cell phone or satellite DAB
receiver etc.
Preservation too not for the dollar value but the aesthetic and
cultural value of having at least a few of items of historic interest,
in as original form as possible.
But also to look at $ value; of vintage cars, for example. Especially
if in good restored condition and especially if all the vehicle serial
numbers match!
And particularly when it is not 'necessary' now to chop up older
radios. Even if you don't have one of those aircraft mounting Command
Set racks (Which came AIUI in 1,2 and 3 set versions) it is possible
to have very neat non-intrusive out board arrangements.
I recall for example that postwar one could buy a power transformer
specifically for these sets with a 24 volt heater winding. Although
there are a number of ways of obtaining that voltage.
In the early 1950s, as an untrained and not very skilled 14 year old,
made a separate power supply (in a vented wood and Masonite box with a
B+ milliammeter IIRC) and out boarded the RF gain, CW switch and
headphone connections. My beautifully made BC455 was untouched!
Have fun.

935. Chassis cleanser ??

I have just started to restore a HQ-145. The external cabinet is 9.7+ and is fine [for now]

The chassis needs a good mechanical clean up. What is a good 'stuff' to remove hard cased surface dust and some minor staining/discoloration?

If the 'stuff' exists, is it commonly available?

I'll second that. Both my NC-183,183D, and various other vintage rigs ran very hot at my nominal line voltage, here, of about 120-125 volts. I now use a Variac in power distribution line for the older radios and set it at 110v. The drop in temp of the transformers was dramatic.... There may, of course, be other problems like leaky caps, etc. so a complete check may be necessary. de K3HVG

Thanks. I went and replaced the electrolytics. Replaced the 330 ohm 7w with a 500ohm 25 watt. The 7 watt was swinging beyond 1K when hot. All the other caps are mylars. The 12BE6 socket had a 6BE6 there. I dont have a 12BE6, so I sent the 6V filament rail to that socket and will run it with a good 6be6. Not the best remedy, but you know how it is! Powered up and got some reception on the two lower bands, nothing on the top three. My changes may have knocked the alignment way off, so I'll realign and see if I can "wake it up", powering thru a variac at 110. Any comments are appreciated.
Pete

There are two likely situations as to why a transformer runs 'hot'. The remedies have been briefly discussed. Let me add some background.

First, the design of the transformer uses a magnetic material that is non-linear. As the magnetizing force is increased to higher levels the B-H curve goes sub linear and the cores starts to saturate [the self inductance decreases] and more primary current is drawn into the transformer [more heat].

The transformer equation for 60 Hz sine waves is E = 4.44*f*N*B*A. Where f equals line frequency, N equals the number of turns on the primary, B equals flux density, and A equals cross sectional area of the core primary. Since f, N and A are fixed, an increase of voltage requires an increase in flux density [B]. B equals the permeability [u] time the magnetizing force [H]. The value u is very non linear and decreases in transformer material as H is increased to higher values above the 'linear' region.

Conclusion, transformer get hot. Solution: reduce the primary voltage as suggested in other responses.

Second, older designed electrolytic capacitors used a 'wet' dielectric. Simply because capacitors get old [don't we all] the degree of 'wetness' dries out and the dielectric dissipation factor increases. The capacitors, in common language, become lossy. The isolation resistance can change from millions of ohms to a value of a few tens of ohms.

Conclusion, I^2*R losses increase in the lower [lossier] resistance. Some capacitors can be reformed. If there is large design margin, spec value divided by stress value [eg; 450 VDC rating/200 VDC operating condition], then it is possible to 'reform' the capacitor by gradually increasing the operating voltage.

Preferably, the older electrolytic capacitors should be replaced.

Either or both situations should be checked to assure that the 'hot' transformer is not over stressed.

Note: transformers typically run at 95 percent efficient. So, some heating is normal.

One trick you can use to achieve 110V from a 120V nominal power line is to take a 12.6V filament transformer with a secondary current rating that is greater than the current drawn by the load, and hook it up as a series bucking auto transformer... The primary goes across the 120V power line, and the secondary is in series between the power line, and the radio to be powered. Pick the 12.6V secondary's polarity so that the voltage drops, rather than raises. If 12.6V is too much of a drop for your situation, you can always use a 6.3V transformer to get 115 to 117V.

Much cheaper than a variac.

-Chuck

Source record: 8684

The changes you have made should not knock the alignment off. I generally like to fix the problems before alignment. Alignment is generally "gilding the lilly".

It is not uncommon to acquire a radio that is off because of alignment. But, even if that is the case, it often means that there was another unsolved problem which precipitated alignment.

You can usually tell when an alignment has been attempted by someone not qualified as they leave their calling cards on the adjustment points.

Once the basics are corrected, you can usually use a signal applied at various stages to check stage amplification. If the radio is working on the lower bands, that is a good start. Look for switch contacts, or high frequency oscillator failure (I have had that with flat 6C4 tubes) or even the mixer tube. Then, carefully check the alignment - being sure to follow the alignment manual and always makr your starting point before any adjustment.

The previous comments have been good.

Another trick that works well on smaller transformer-powered
receivers is adding wire wound power resistor in series with
the transformer primary winding. I use Dale chassis-mount
30-ohm resistors (the style with tabbed aluminum shells)
for a lot of early Zenith restorations.. Often the filament
voltages are pushing 7 volts, and the transformers running so
hot you can't touch them--and that's after replacing all caps.

All the electrolytics are bad. Every single one of them. Eventually
they'll wreck the transformer by pulling too much current, or one of
them will explode and spew shrapnel all over the inside of the case.
Change them out.

I use some stuff called "Hood Cleaner" made by RubaChem Inc. Computer
maintenance division, PO Box 9841, Englewood, NJ 07631,
1-800-548-3285.
This is a foaming type cleaner. You spray it on and let it sit for a
while. It will loosen up the cooked on dirt etc. Seems to be real safe
on plastics etc. I would not use it on silk screen labels, especially
on dials that type. Avoid spraying on components that can absorm
moisture. Spray it on a cloth and wipe around sensitive components or
areas.
It really works wonders on cigarette smoked up plastic. Hope this
helps.

I can't pinpoint a particular serial number to a particular year, but anecdotally I can tell you that I first saw a Ranger I in the fall of 1955 at the home of one of my early ham mentors during the time between taking my Novice test and the actually issuance of my license in January 1956. (The FCC took about 3-4 months back then to get a ticket to you after you took the test.) I think it was introduced about 1954 or early 1955. I was a 13 year old 8th grader at that time. I built my own Ranger I from a kit in the summer of 1959 just before my Senior year in high school, but didn't get to use it much because I went away to college the next year, and spent 5 years in apartments after college. I used it on CW quite a bit in the late 1960's when I bought my first house, but by that time AM phone was pretty much obsolete. As I was away at college at the time I can't tell you when the Ranger I was supplanted by the Ranger II but I would guess the early 1960's. What I can tell you is that the Ranger kit was about $279.00 in 1959 (and about $249 when introduced) and the wired and tested version was about $100 more. When you consider that rigs back then required separate receivers and transmitters and a complete station (I had a Hammarlund HQ-100) would run about $500, you can see that modern transceivers in the $700-1500 range are actually quite a bargain when inflation is factored in. When I bought my Ranger, I was making $.90 an hour in my part-time after-school job at the public library in my Wisconsin hometown. I paid for the transmitter when my folks arranged a loan for me from my insurance policy. My folks bought the receiver as a Christmas present. Between my initial licensing and the building of the Ranger, I used, in turn, a Heath AT-1, a Johnson Adventurer and a Globe Scout 680A, the first two bought used and the latter built from a kit from the proceeds of my very first job...teaching Morse Code as a Boy Scout camp staff member.
The transmitter was just known at the Viking Ranger and the designation "Ranger I" was an informal one given to the rig after the Ranger II (which is what Johnson called it) was introduced. Aside from cosmetics and the paint job and the elimination of 11 meter coverage when 11 meters became the CB band, I don't think there was much functional difference between a Ranger I and a Ranger II. There may have been some circuit changes but I don't know what they might have been. If there were any evolutionary changes during the production run of the Ranger I, they must have been subtle because I don't remember any Johnson ads mentioning it.

My Ranger worked quite well when I finally got to use it. The fatal downfall of my rig though was when a temperature compensating capacitor failed in the VFO section and the rig started to drift all over the place. The original component was no longer available seemingly anywhere and I must have tried 50 other NPO capacitors of varying values to try to correct that drift. I never did get it fixed and finally bought my first SSB transceiver, a Drake TR-4.

I sold the rig in the early 1970's.

Jon Teske, W3JT (I was K9CAH and later W3DRV in those days.)

Well, all the voltages are right at the power supply with the new
caps. The transformer runs cooler, I was able to align the 230 kc IF
but cannot get a peak from the 2215 kc IF section. Im going to have to
order a 12BE6 as it is the 2nd mixer 2nd conv osc where the 6BE6 is
now residing. Thanks for your comments.

[snip]

The Ranger II added Six meters in place of Eleven. It was introduced at about the same time as the Class D citizen's band, IIRC about 1964. At the time, Six meter AM was very popular, since technicians had full privileges on the band, so six meters was a good "mid life kicker" and the Ranger II was produced for several more years.

I stand corrected: according to http://www.radioing.com/museum/tx4.html,
the Ranger II was made from 1961 to 1965. I didn't know the class D
citizen's band was that old.

The creation of the CB band was at the expense of the old ham 11 meter
band (not that anyone used that band very much. The original Ranger
was able to tune 11 meters and the VFO did have calibrations there.
Eleven meters was eliminanted for ham use in the late 50's.
>
The Citizen's band WAS that old, I would guess +/- a couple years
around 1960. It was not initially very popular and it was intended for
some low level commercial use...companies dispatching trucks and the
like at the local level. (Remember tube radios were still the rule and
were quite bulky.) It took until the mid-1970's when cheap
transistorized transceivers were introduced for the CB band and were
adopted by over-the-road truckers. I would suspect that some popular
folk idioms such as the then-popular Country-Western song "Convoy" and
a couple of really stinkin' movies with CB featured in them captured
the imagination of ordinary folks and a lot of people who really had
utterly no need for a two way radio could get a CB to put in their car
for about $50 or so. This caused so much bedlam on the band that the
radios were functionally useless in metropolitan areas (I live in the
Washington DC/Baltimore area) and didn't serve much purpose until you
got out on the open road. It did make something of a cult though of CB
and certain folks tried to use CB in more of a ham mode including long
distance comms ("skip talking") and power escalation with (illegal)
high powered amplifiers, many the adaptation of the ten meter portion
of legitimate ham amps. This caused the nearly 30 year prohibition of
the sale of amps capable of working in the CB band which of course
meant any ham amp with ten meters on it. The little I listened to CB
(my carpool mate had one in his car) sort of revealed that the chief
purpose of the CB for most folks was to spot speed traps. "Smokey Bear
is hiding in the bush under the I-95 overpass." My car pool guy took

his out of the car after a couple months. In less populated areas where interference wasn't so pervasive they did serve some purpose. I recoiled in horror when my father had one in his car in my small Wisconsin hometown and took on the personna of "Diamond Don" Sheesh!!!! "Diamond Don, Diamond Don, got your ears up??" All my efforts to get my dad into ham radio when I was a teen were shot to Hell. (I wanted Dad to become a ham with the obvious ulterior motive of financing my hobby...a 13 year old's allowance didn't go very far when trying to buy rigs.) When dad died, I inherited his three CB radios which I promptly donated to Goodwill. The CB boom was long over by then and even Dad didn't have one in his car anymore. I haven't bothered to listen up there in years.

Actually CB was quite popular by the late 1960's and there were several
organizations founded to provide assistance to travelers and similar
functions provided by hams.

It was populated by pleasant. well mannered people until the trucker's
strike (1976?) when almost overnight it took on it's current form.

The Citizen Radio Service began in 1947, and the first Class D Citizen
Band licenses were issued on September 11, 1958. Not sure when they
were discontinued.

Interesting...I had forgotten that. The time frame seems about right. I was aware that there was CB activity in the late 60's and many towns even had little signs that said a local club was monitoring some channel (other than 19) to provide help. That probably coincided with the first all transistor tranceivers which made a CB rig practical and small enough to mount in a car. But in the mid-70's when it really took off things were pretty much bedlam. Even DX pile-ups were kids' play compared to trying to communcate on a CB radio for a while. When my carpool guy had one, he only made one conversation and that was with a car that was directly in front of us. I'm not sure how the legal ramifications of this worked, but our carpool passed over I-95 between Washington DC and Baltimore. The Maryland State Police Barracks located on that highway had a lady passing out traffic info to truckers. She clearly had a much higher powered station for she was clearly readable. She seemed to become semi-legendary and it appeared that every trucker going up and down the East coast knew her by her first name. The other think CB was used for during commuting hours was during the two gasoline supply crisies (1973/4 and 1978) many mobile CBers were on trying to spot gas stations that had supplies and no long lines. In the latter crisis, one of the radio station helicopter spotters flew over the tank farms and noted that all the tanks were filled to the top...the gas companies had created an artificial shortage and were hoarding gas to drive the price up. When this news got out the crisis subsided immediately. I have not trusted the

petroleum companies ever since.

There was some sort of Citizens service throughout the 50's as you say, but it wasn't on 11 meters, or at least not on what had been the 11 meter ham band. I know there was some sort of licensing. If you bought a CB rig, it usually came with an FCC form inside to send in for a license. You were supposed to wait until you got the license and you were issued a callsign. The callsign took the LLLL#### format. The callsign scheme was almost universally ignored and most folks transmitted anyway using personally derived "handles" e.g. "Rubber Ducky" of the Convoy Song fame. There were even some entrepeneurs who proclaimed to "register" your handle for a fee, but of course that was meaningless. Not terribly long thereafter the FCC appeared to give up and did away with individual licensing. (In theory, There is one "universal" license issued nationally for the entire CB band. The samething happened to the pleasure boat VHF marine licenseing. Shortly after I had gotten an FCC Marine VHF ticket (at a fee) the FCC simply said that there was one VHF Marine license issued for the country and as long as you operated within the US and territorial waters you just had to ID youself by your vessel name. You were supposed to have a license if you took your boat to Canada or the Caribbean for example. I suspect this is widely ignored. A marine HF license still is

required though at the individual level according to the marine press
(I don't have one, only the domestic VHF.)

That's true. The original Citizen Band prior to the one we know today
was on 460 to 470 Mhz, and there were two licenses. A and B. The
problem with that was that there was very little equipment that could
operate at those frequencies. That was when the FCC took the 11-meter
band away from the amateur radio operators and started the 11-meter
Citizen Band with the Class D license in 1958.

I was just thinking about the Citizen's Band and ways it can be improved.

1. Petition the FCC to give hams all privileges from 26 to 28 MHz.
2. Have a free "afterburner" session, and invite participants to
bring cheap CB amplifiers for destruction. Prizes to the one
which ignites first, etc.
3. Offer free "Polarization parties" to twist the beams of former
CB'ers over to horizontal. Awards for 5/8 wavelength whips
which are also changed over.
4. Eliminate the power restrictions on CB, and instead institute
a "Purity of emission" standard, to include language, common
sense, and experience factors.

Other suggestions welcome; the filing deadline for my petition is April
First.

When I said popular, I was refering to the operation within the U.S.
law (which was and is very different than the rest of the world) which
prohibits "skip" operation.

Most of the useage at that time was still families keeping in touch,
aid to motorists, etc. Almost overnight during the truker's strike it
became the home of what seems like a bunch of 12 year old's with
walkie-talkies.

At one time there was a reasonable license fee (about $10 a year). Then
the FCC raised it to $25 to help keep usage low. Someone sued complaining
that it was unreasonable and won. The FCC then started issuing free licenses
as compensation for their overcharging. Then they started allowing
temporary call signs ("K" your initials and your zip code) so mine would
have been at the time "KGSM19120",

I even had a license with a real call sign, but I've long since lost it
and forgoten the call. I wonder if there are CB callbooks from the
1970's and 1980s? I'm no longer in the U.S. anyway but I believe if you
were issued a call, you can still use it if you want to.

Eventually, it became too much trouble and expense to issue free licenses
to people who never used them anyway, so they issued a blanket license
to anyone on U.S. soil.

Possibly someone else can fill in the exact time line.

As for outside of the U.S. it still flourishes as a no-code no-test
amateur radio service. In the E.U., there are few restrictions on
what you can do, including less limitations on transmitters, FM,
and packet operation.

There are even a few European websites devoted to using CB to "improve
the radio art" e.g. experimental antennas.

The U.K. had a 927 mHz CB service which was canceled when the frequencies
were assigned to GSM cell phones.

Geoff.

Not at all. It just mandates a certain power input to the finals.

During REALLY GOOD conditions, 4 watts will get you plenty of skip.
I don't remember 1968, but I remember 6 meter cross-country stuff
with milliwatt CW outputs in 1979. And the NEXT cycle coming up is going
to be even better.

Note that Class D wasn't all there was. There was Class C which allowed
pulse modulation in the 26 MHz range for remote control, and Class A
citizens band which was AM in the 450 MHz range. I don't recall what
Class B was.

I had a class C and D license. The difference was ticking a box on the
application.

FS R-599D/T-599D Kenwood Twins.
These are the Champagne faced twins. I would rate these at least 8.5
cosmetically. The face plates are perfect. There are a few small scratches
on the cabinets. They are working. The receiver has good sensitivity. The
T-599D has full output. All interconnecting cables including the transceive
cable, original manuals, and the S-599 matching speaker are included.
Pictures are available. Asking $425 + shipping.Thanks,
Charlie Hugg, K5MBX

Since I never operated CB except for one short contact in my carpool mate's car to show him how it worked, I was not intimately familiar with CB rules. I seem to remember thought that there were regulation which prohibited even attempting to make a contact of over 200 miles (or so) even if conditions permitted this. I seem to remember that this was one of the ways to attempt to rein in the use of powerful amplifiers that many CBers used (of course the prohibition of the sale of amps capable of operation in that range, including those intended for ham use, was another FCC mandate.)

Anyone know more about that??

I don't know the licensing requirements, but I think that there is also a frequency or frequencies at 72 MHZ available for radio control of models in addition to 26MHz; and, 50 MHz if one is a licensed amateur.

Anyone up on that?

I did just this once in my job. (I wrote about this a few month ago in some other forum).

I was a US Gov't telecom policy type supervising an upgrade at a facility in Guantanamo Bay, Cuba some 25 years ago. We were putting in some new solid state multichannel demodulators at a comm station. We were replacing some old tube-type demods which actually were tunable low-frequency RF voltmeters which dated from the late 40's or 50's. Each one of these old demods could only tune one channel so a 24 channel system required something like four tall 19" panel racks. They were cumbersome to use, always drifted off frequency and were a bear to maintain. The new demod only required about 5 inches of a single relay rack, so there was a huge floorspace savings and of course the new demods were a cinch to use and required virtually no maintenance.

These old demods had been a thorn in my side for many years at many facilities. Mercifully it was only the Navy that had them. (I worked with all services.) Regulations said that the decommissioned equipment was to be returned to a Navy depot in the States for reuse. This is exactly what I wanted to avoid for any time I wanted to upgrade a Navy facility, Big Navy folks would always tell me that they wouldn't buy modern equipment because they had a couple hundred of these old things in depots. So the last thing I wanted to do was sent them back to the States. I asked the Commanding Officer of the Gitmo facility what options he had. He said he could either return them to the depot or turn them over to a training function. Since we were surrounded by a decidedly unfriendly Cuba on three sides and the Caribbean on the fourth side, I asked the CO if he had ever had an emergency destruction drill. He hadn't. His facility had emergency destruction incendiaries in place but we couldn't burn that down so we took all these old demods to the firing range, stacked them up in piles, and place Thermite charges on the piles. It didn't take very long to reduce the demods to molten metal and glass. When I prepared the "Disposition Report of Excess Equipment" for the CO's signature, I simply stated that the equipment was transferred to a "training function."

FCC rules 95.412(9) prohibit communications or attempts at
communication with stations more than 250 km or 155.3 miles away.

In 1972 as an Officer Cadet we had to write a military paper on any
subject. I wrote a paper which looked at the RF spectrum as a valuable
natural resource, and how CB had progressed (or should I say regressed)
to the point where that portion of the spectum was a writeoff -- it
could no longer be controlled, or as cmdr buzz corey writes "..it
can't be cleaned up."

I might add that because of originality of thought, I won the
prize for best paper. I was particularly proud because I was the
only Navy guy in the middle of about 100 Army and Air Force cadets.

Sure it can! 11 meters is right in the middle of the old 27MHz ISM band. Find a need for high power 27MHz RF heating, and poof away goes CB. Hmmm? a 27MHz "microwave" oven.

Bill,
The TCS is: a) worth getting going (if you have the interest) and b) it is a boatanchor, in the truest sense. The aforementioned becomes especially true if the power supply is one of the several associated with the original TCS system. As with most boatanchor equipment, condition is one of the pivotal issues; does it look good? Does it look very good? Whether or not it actually works, as is, is of secondary importance. I'd be pleased to make you an offer, but in this case, shipping would be considerable. I'm sure there are numbers of folks who'd also be quite interested, too, and would like to know better what the condition of the gear actually is.

de Jeep/K3HVG

Yes, it is worth getting it going.

I have both the ac supply and dynamotors for mine.

The biggest drawback I have seen in the TCS transmitter is that lame carbon microphone arrangement.

My junker (but operational) TCS transmitter has been modified to accept an external audio driver.

And the CW/Phone switch has been rewired to allow both 1625 PAs filaments to be on.

Get about 35w out with audio comparable to an ART13.

From a 1999 post, the scheme is apparently
signal frequency divided by 8 for transmit
and
signal frequency minus 10.7MHz divided by 9

The first puts the crystals in the 18MHz range, which sounds
right, but the receive puts them in the 14Mhz range which seems
a bit low.

But, some other posts show the same scheme, so it must be correct.

I have just about finished restoring and re-calibrating a 47 year old HQ-145. I have only one issue left.

The input stage for the first rf amplifier uses slug tuned inductances. The slug adjustments proceeded normally for the BC, 160-80, and 40 meter bands. The slug for the 20 through 10 meter band is "STUCK".

The inductance is packaged in a typical i.f. can with top and bottom openings. Does anyone have any 'hints and kinks' for unsticking the slug? BTW, the radio is operating on 20 meters and responds moderately well to a signal generator on 10 meters. I would just like to peak the response.

Ideas??

>Does anyone have any 'hints and kinks' for unsticking the slug?

You might try using a hair dryer on LOW, GENTLY warming the can. I "unstuck" several slugs in this manner. DO NOT OVERHEAT!!!

I hope this helps.

Oftentimes what appears to be a stuck slug is actually a broken slug.
If the slug has a hexagonal, square, or triangular hole that passes through
its center, and the slug splits along that hole, the tuning wand will cam
the two halves of the slug tightly against the walls of the coil form, and
the harder you turn, the tighter the slug will hang on.

The answer to this sort of problem is to glue the slug halves together with
crazy glue. A single dot of glue, inside the slug's hole, applied directly to
the crack with a toothpick will do the trick. The amount of glue must be very
small. Less is more in this case.

An alternate method is to glue a round toothpick into the broken slug with epoxy.
Again, dip the toothpick into the epoxy, and slide it into the hole without
touching the coil form. Use the minimum amount of glue that will stick the pick
into the slug's tuning hole.

-Chuck

Many of the forms used in the HQ145 are made of a very cheap
plastic that has become extremely brittle and friable with age.
Something else to watch for.

Pete

I bought this receiver as a winter project, but winter is about over
and I still haven't got to it.
It looks in great shape, but only locks up on one band (26.5).
It does make noise (background not crackling).
I have a copy of the manual with it.

$450 PICK-UP ONLY IN LEXINGTON, MA

Is that still in effect?

The rule died here in .ca with the license requirement. That was what,
around 20 years ago?

Yechhh! I hate it when this happens!

I have experienced this several times in the last few years, the most recent being this past week while aligning a 60s vintage transmitter. My personal experience is that glueing the broken slug back together has never worked for me. Apparently the breach throws off the properties of ferrite slug. What always has worked best for me is to swallow hard, utter the words "damn it" and then proceed to repair the problem. My repair is to VERY CAREFULLY pick out the broken pieces with a needle nose pliers. Nibble away at the old slug with the pliers if necessary until you've removed the old slug like a decayed tooth. . Drilling it out does nothing except twist the plastic core around the bit and ruin it. I then replace the slug with a comparable one found in the transformer can of a 60s vintage stereo receiver I keep on hand for just such parts.
By the way, I have performed "autopsies" on defective slug coils by razor cutting them down their sides and each time has revealed the slug was lodged in a cross-threaded configuration. I have never been able to free a cross thread inside a coil.

I have tried a number of frustrating methods to remove the broken slug - all to no avail. I did repair a number of slugs in the HQ-145. I ended up making new coils with new forms and new slugs.

But, I think Chuck has the right and only approach. The problem is that the core breaks and acts as a cam. Once someone tries too hard, bits fall off the slug which will cinch the destruction. But, if before any particles end up between the core and the threaded form, the super glue can be used to secure the core enough to preventing it from "camming", then the core can be removed. Once it is removed, I think it can be glued properly with superglue. If you decide to use a different core, it must be the same material - not just the same thread.

I think I would probably illuminate a led and insert it into the bottom of the core and press on the form just before using the superglue to center the core.

The core may actually be more unreplaceable than the form. In some cases it might be a good choice to destroy the form to save the core - then glue the core fully and make a new form. It is possible to get a form slightly larger and use hot melt to create threads for the core. Something like a large straw might work as a form.

It does, UNLESS you use a ferrite cement intended for just that application.
GC Electronics makes some that I have used with success before.

That was taken from the latest Part 95 posted on the FCC website. So
yes, it is still in effect in the U.S.

Yeah but!! Soon you will be QSLing from the desert south west USA. There you won't have to shovel frozen rain flakes so, you will have more time to work projects ... like new towers, like going fishing, like chasing women, and, oh yes, fixin up old radios :-)

73, DD, W1MCE just finishing up an old HQ-145 [with one stuck slug].

Except for communicating with other stations on any
channel and having to use a call sign, most of the
original rules are still in effect, ie. no high power,
no talking over 150 miles, etc.

Now they say the blanket license covers all legally
operating stations.
If you're operating illegally then it's considered to be
operating without a license.
Fine, $10,000 per day, per offense.

I am starting the reassembly of my Ranger. The large brass VFO dial drive mechanism (Jackson Drive?), is a bit tight and bumpy when turned. I tried getting a little light oil down inside where the thing rotates but this didnt seem to help much. Can this thing be taken apart and lubricated somehow? After turning it a bunch it seems to have loosened a slight amount but still can barely turn it by hand and feels like the bearings are dry. Any suggestions?? Thanks de Randy, WB5KCM

OM, I'm holding one of those in my hand, even as we speak. It feels bumby, so to speak, and is dry as a bone. What I've done is work in some WD so as to clean some of the old grease out and then work some new lubricant in. I'm told the unit uses a pressed in bearing and can't be taken apart, short of ruining it. That's the word I have.... It worked on two Valiants I've re-done and the drive is the same as on your Ranger.

When you say WD, are you sayng WD-40 ? You are spraying on the drive
and then rotating it until you feel like it has gotten into the
bearings? Thanks

Yes, exactly. WD-40 is not a real lubricant (grease or oil), in reality, so one needs to replace it with something permanent, at some point. I've been messing with this old one I have, at the moment. The WD-40 made it somewhat better but the old grease is still flaking out.

Beings that this one is a goner, anyway, I tried to "open it". I guess I have to agree with the sage advice I once got. It appears it is sealed or maybe that hex-shaped end threads on to the mounting threaded end? It looked like it might. But, no... it won't come apart and all I've done is make it far worse. Don't try this with yours or it'll end up like this one!!! hi!!

Just try and lubricate it externally.

Hey Jeep, I will take your advice! I am letting it soak in WD-40 now to see if it will get a little inside and loosen up some of the old grease. I will then attempt to put something a little heavier in there, oil or grease. I did put it in my cordless drill and run it back and forth for a while and this seemed to help a little. I noticed that it gets a little warm doing this and shows that all the old grease has long since dried out. 50 year old grease. Thanks for the info. 73, Randy, wb5kcm

1013. Re: Chassis cleanser ??

Newsgroup: rec.radio.amateur.boatanchors

Message-ID: <rOSKh.11$4t7.6@newsfe05.lga>
Source record: 8609

Tried and true method:

Remove all the tubes and anything else that can be taken off or out. Fill a squirt bottle, preferably a nice big one with adjustable nozzle, with denatured alcohol (about $12/gallon) and give the thing a shower. Keep spraying in every nook and cranny until the runoff is clear. Warning - you will go through a lot of alcohol so buy two gallons. The adjustable nozzle helps a lot; some areas you will want a wide spray and others you will want a thin strong stream. After the runoff is clear, keep spraying some more. Then some more. Keep bathing the thing until you run out of alcohol or your hand starts to get cramps. Another warning - do this outside - the fumes are strong although not particularly toxic.

Then let it dry for a few days. It will come out perfectly fine, with absolutely no harmful affects. I would NOT use water, although I hear people do it.

This is also the best way to remove cigarette smoke smell and tar from electronics. The alcohol dissolves the brown gunk like nothing else; it's amazing.

Oh wow! Be careful with alcohol, it will wash all of the wax out of any coils,
and capacitors, and simply destroy any plexyglas or lucite insulators. I use
isopropyl for some very careful spot cleaning, but water and a good detergent
like Simple Green is 1000 fold safer for the electronics.

You don't want to take your garden hose to the thing, but a spray bottle
full of Simple Green, and a brush to help out will allow you to selectively
clean up the mess, and then wash it down with deionized water. A pump up
garden sprayer meant for herbicide is just perfect for this job.

When you are done, put the radio in a cardboard box that is open on both
sides, so it is like a tunnel, and put an electric heater that has a fan
on one end, and let it dry for 24 hours.

-Chuck

Has anyone ever replaced the transformer in the power supply with a
heaver transformer?

If so, who could I contact to do that for me?

What would be the advantages?

Thanks!

Fred

I've heard about this procedure before. The individual who informed me suggested that I include a small piece of steel in the adjustment hole prior to the SHAMACK [I guess SHAMACK was used because it is St. Paddy's day]. After the SHAMACK take a needle nose and bend the steel wire into a broad 1/2 loop.

File one end until it is sharp, then go fishin'.

Do I understand your suggestion properly?

:-)

I wonder if soaking in a solvent like Naphtha would work
better than the WD-40. It might take a couple of soaks to

clean it out, that is, assuming the stuff can get in at all.
Then, if you can get it clean relubricate by soaking in
light synthetic oil. The problem with trying to replace
grease is that you can't get it in where oil might
penetrate.

Fred,

I have done what you're speaking of on one of my L4B's. The original supply is not the best design and does create some noteworthy heat. I used a Dahl transformer with a full-wave rectifier. I also use Zener-derived bias voltages. The thing runs cooler and should last a long time. I didn't care to up-grade the cooling in the amp itself, so the power levels are about the same, maybe a just a bit more. On the other hand, my second L4B still is running just fine after re-building the diode boards and changing to bias over to Zeners. The bleeder resistor doesn't smell anymore, either. As far as who might do the work for you, I can't offer you a source.

It looks like the WD-40 did penetrate. I let it soak over night and
then ran the drive back and forth with my drill. I noticed that there
was some very dark oil coming out of the seams. Tried oiling it with a
light gear oil while running it with the drill motor. The oil seemed
to penetrate into the seam area. After all this was done, I really did
not see any improvement. I will go ahead and use it like it is. Its
actually no too bad, just not as smooth as I would like. I will be
looking for a smooth drive replacement later...maybe find one at a
hamfest or ebay later. Thanks for all the input and suggestions. I am
going to go ahead and put the Ranger back together and get it going
now.

Actually the CB regs _do_ (or at least did) prohibit 'skip' operation.
Look it up. Communication between stations more than 150 (IIRC) miles
apart is expressly forbidden.

I can confirm the existance of 'distace' restriction. As I recall, it
is 150 mi., not 200.

>Anyone know more about that??

Note: the amps were illegal regardless, as there was a limit of watts of
power in to the final amp, and a maximum of 4 watts RF energy out.

It is worth noting that when 'skip' conditions were right, it did not
take large amounts of RF to reach long distaces. I used an '11 meter'

(but _not_ 'citizens band') rig with just under 2-1/8 watts (measured!) RF out, and one day was asked to shut down, by a station nearly 900 miles distant. I was _so_strong_ in their area that legal max (10 watt RF) stations couldn't communicate at 6 blocks distance.

>Anyone up on that?

"way back when", there was 2nd set of frequenceis, besides the 11m ones for RC controls. I don't remember at this remove (roughly 30 years) just where it was. Was not used much, gear was much more expensive.

And yes, there were some ham frequencies where RC operations were allowed.

If I understand what you have done, you have lowered the plate voltage of the finals as compared with the original circuit running with the red rocker switch in the SSB position. Did this seem to affect the linearity of the amplifier when operating SSB?

> anyway) absolutely harmless to everything I've sprayed it on.

I made a bunch of front panel overlays for one customer. They were plexiglas, and they were engraved with my little CNC mill. I painted them black with a satin finish Krylon paint, and put the white lettering in with latex paint. The latex hardened a little too fast, so I wiped the lettering off with alcohol. That destroyed the baked on Krylon paint. So, thinking that I could salvage the whole mess, I put the panels in to soak in alcohol, and used a brush to remove the paint. It worked great, until big cracks started to appear in the plexiglas front panels. The cracks started to grow from the holes where the controls passed through. It was a total loss, I had to remake all of the panels.

Ever since, I have been very careful with alcohol on paint and plexiglas.

The other place alcohol has caused me problems, is it wipes the lettering off of HP test equipment, and it wipes the black chassis paint off of old DEC computers (eg. PDP8's, etc.)

And alcohol will remove the color bands from some of the older epoxy dipped resistors. They used to be marked after they were measured, and the paint they used was not very good. I found this out because...

I use alcohol to remove rosin flux from PCB's that I manufacture without a single problem. New parts are immune to its effects.... but also to water's effects... so I very often use a water clean flux, and a 4 quart ultrasonic cleaner.

Ultrasonic cleaners, will kill older hybrids, such as used by HP in some of their mid 1980's test equipment... Everything has its problems, sometimes.

-Chuck

Note, I import 4 quart heated Ultrasonic Cleaners if anyone is interested.
All microprocessor controlled, and very effective for cleaning larger assemblies.
$500 in QTY 1.

John, No, not quite correct. In reality the Dahl transformer upped the
B+ about 7% and it also doesn't sag, key-down. Linerity appears just
fine. The idle current is down about 50%. The bias circuit is almost
identical to the Heath SB-220.

1031. HQ-180 for $450?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-03-18 16:29:39 UTC
From: Rick <Nospam@reply.in.gp>
Message-ID: <pan.2007.03.18.16.29.38.155064@reply.in.gp>
Source record: 8626

Today I saw a Hammarlund HQ-180 (not the "A" model) for $450. This seems to me to be a bit on the high side of reasonable and I wanted to see what you all think.

It looks like it's in better than average cosmetic condition, though not "mint" by any means (looks like a 50-year-old radio that was well taken care of but is, after all, 50 years old). Inside is a bit dusty but I didn't see any corrosion.

Unfortunately, where I saw it wasn't anyplace where I could plug it in, hang a wire off the back, and check it out, but I am arranging with the owner to be able to do that sometime in the next couple of weeks.

It has the clock (so, I guess that makes it the HQ-180C model).

It has the original owner's manual.

When I go to check it out, what are the main things I should check for, other than the normal ability to receive across all bands?

If I can borrow a signal generator from somebody and take it with me, what level of sensitivity should I expect?

What are some of the options for that model of receiver that I should look for that might make it worth more?

What do you all think of the $450 price, if everything works?

1032. Re: HQ-180 for $450?

You can check past prices on Ebay by going to completed sales area.
(You do have to register for Ebay to go to that portion) There you
will see what people are actually willing to pay for this and nearly
every other receiver. This is, of course, the true measure of what
something is worth...the price people are willing to pay.

It does seem a bit high though. I'd say maybe $350 for a decent HQ-180
in working order in clean condition.

Source record: 8628

For reference/comparison purposes only.

The HQ-180 is much more radio than the HQ-145. I just finished the repair [minor 2 resistor replacement and electrolytic reforming], replacement of three tubes, realignment and recalibration of a HQ-145 where the cabinet was in 9.5+ condition and the interior was hard dust [still needs a little careful brushing of some surfaces].

The AVC/AGC circuit is a hybrid and is set ONLY for AM. The design of the S meter circuit is disabled by design on CW/SSB. The calibration/realignment produced the same response at S7, S9 and S9+20 in the AM mode as my ICOM 746 when calibrated against a signal generator [in a transfer mode calibration - switching between both radios in one common setup]. The 746 does have better MDS. My signal generator does not produce reliable outputs below ~S5.

For $$$ comparison I paid $227 for the HQ-145 on Ebay two weeks ago.

The HQ-180 does sound a bit high at $450. But, if it is in GREAT condition and operable as it stands ... maybe??

Perhaps the bearing surfaces were damaged. If you get a
replacement it might be interesting to take this one apart
to see how its constructed.

I'd say thats way too high. My $.02 anyway.
Don't be embarrased to ask to see under the chassis.
I've seen a number of rigs that looked super nice
on the outside/top of the chassis that were a horror
underneath.

Check all bands and look for intermittent switches.
Sometimes all thats needed is a good cleaning.
Other times the wafers can be cracked, or just
plain worn out.

Lots of these around. If you see anything that looks
funny, be patient and find the right one for you.

IIRC, there was some RC at ~49MHz. ISTR some in the 72-76 MHz range as well, but since aircraft marker beacons operate at 75 MHz, I may be imagining.

> And yes, there were some ham frequencies where RC operations were allowed.

Hams can use almost any VHF or UHF frequency for RC: in fact, some RC competitors have obtained ham licenses just to get access to interference-free channels and thus away from the "clothespin competition" so often seen at meets.

Amateur radio invented remote controlled vehicles, certainly as a hobby.

Since amateur radio was a technical playground, and fairly open rules
to allow that, it was there when someone wanted to fly a remote controlled.
Years ago, there was a bit in QST about early work in RC airplanes, I think
it was Ross Hull (the Australian ham who moved to the US to work at the ARRL
and was never licensed in the US, and died by accidental electrocution) and
Roland Bournes.

It took no special license, since it was allowed under the rules. It
was only later, when the hobby became more popular that a need for
an RC license that didn't require a test came about, with frequencies
set aside for the purpose.

There was a whole period when people would get a ham license because
they were interested in radio controlled vehicles.

That faded with the arrival of RC licenses and frequencies.

The "frequencies" for RC in the ham bands were a combination of where
it was legal to send that sort of thing (but it wasn't specifically
about RC) and gentlemen's agreement, since one didn't really want
interference from other operators when flying an RC plane.

After my Ranger is on for a short period of time, I am noticing that the final plate current starts creeping up slowly and will continue to climb if I do not power off the transmitter. I have the PTT mod in there where it grounds the screen through the 5K resistor. It does this in any mode position until I switch off the power. I believe that the 6146 maybe self oscillating? I do notice that the screen voltage (pin 3) increases along with the plate current even though it is grounded through the 5K resistor. Possibly it needs neutralizing or I have a bad 6146? Any ideas will be most appreciated. 73, Randy, WB5KCM

Yep, its definitely on the high side. Might be OK for eBay where the
shills bid against you to artificially raise the prices (now you know
another reason for identity theft) and people are so nuts about something
that they will pay out double or triple a decent hamfest price for
something in their dreams.

Even if it works up to snuff (S-meter, sensitivity, etc., all work), I'd
still be looking at $200-250 tops, as my offering price. Be willing to
walk away, or at least if he says no, then tell him you'll think about it.

> It has the clock (so, I guess that makes it the HQ-180C model).

Ask to take a screwdriver and take the chassis out of the cabinet and look
underneath. Rust, dust, cobwebs, smoke deposits, cracks in anything.

> If I can borrow a signal generator from somebody and take it with me, what
> level of sensitivity should I expect?

Hook some 10-20 feet of wire, and maybe a small portable antenna tuner and
see what it sounds like listening to anything across the bands. On the top
band (about 12-30 mHz) you might not hear much because not much is there
except at the low end.

> What are some of the options for that model of receiver that I should look
> for that might make it worth more?

Matching Speaker? Maybe some other guys will have some ideas.

> What do you all think of the $450 price, if everything works?
>

Fine for ripoff eBay price, but still high even if in mint condition. If you are too far from hamfests and can't wait, then its your price or talk the guy down. I've seen really really outrageous prices (surely bid up by shills) on eBay.

Here is another item to look for: the old style first "printed circuits". What they did was mold a network of resistors and capacitors into a molded "chip" and it hangs there, suspended in mid-air, and they don't make those any more. I had an HQ-170 that had one of those and you could not find out what was in that network because the manual just showed it as a box with leads coming out. If it goes bad, then you would have to guess what was in it. Examine the manual to see if there is a "black box" square in the schematic that does not tell you what is inside. So, if it craps out, you might be up the creek.

SNIPPED

The HQ-145 I just finished refurbishing has two of those circuits in it. One is the AVC/AGC network; the other is interstage coupling for the audio output.

The schematics for both are shown within the field of the basic receiver schematic.

The schematic for the HQ-180 at the BAMA site shows the parameters inside the hybrid.

I agree it's high. I sold a very nice HQ-180AC for around $200 at a swap meet a couple of years ago. Of course, swap meets are full of chronic cheapskates :-)

That receiver is new enough that it doesn't use a bunch of old paper capacitors, so there is not much to check apart from what has already been mentioned.

I enjoyed my 180, although the audio quality is nothing to write home about. Receivers with push-pull audio are more to my taste.

If it has a matching Hammarlund speaker, that adds to the value. Those may sell for $50 to as much as $100 if the right person wants one. They are much more scarce than the radios themselves, since some purchasers used a different speaker or headphones. I regret selling my speaker for as little as I did.

Pete, If some individual comes through with the pinout for you, great. Avionics schematics are not as prevalent on the web as ham and comms gear, as you probably have found out. I'd recommend a trip to your local general aviation airport and seek out the avionics shop. I'm sure they would be kind enough to let you have a peek at the appropriate Narco book. If you needed Bendix or Motorola ADF's, I could help.

Thanks.....I appreciate that! It was your reference to the Bendix T-12B
a few weeks back that allowed me to get my unit up and running. All I need
now is a 600 to 8 ohm matching transformer and I will be all set. That T12
is a pretty cool radio.
I also have a King KR-85 (later version). That unit also works very well.
I just bought the Narco unit tonight from eBay for 38 dollars. The reason I
liked this one is because it appears to have a small S-Meter right below the
main tuning dial drum. It appears that there was more than one iteration of
this radio.
My coolest radio this month was a Lokata SRX. This is a synthesized marine
ADF that covers from 100kHz to 30MHz, and also, the FM band. I am waiting
for an owner's manual from David Searle Electronics so I can figure out all
of the hidden functions. I just like those unusual radios!

Yeah, the trouble with that is, the next words out of his mouth after he told me his asking price were "If I can't get that for it, I'll just put it on ebay".

By now pretty much everybody knows about ebay and they know they can get hundreds more than the true worth of something, which of course then only serves to raise the "true worth of something" if you define "worth" as "whatever someone will pay for it".

I asked him to call me if he hadn't sold the radio by the end of the hamfest and I haven't heard from him, so maybe it's moot and he managed to convince someone to give him his price for it.

Oh, I have, and do, regularly. I check ebay at least twice a week.

As I write this I have a web browser up on ebay's "Completed Sales" page for "Hammarlund 180". I see three of them as having sold in the last (however long it is that those listings stay on "Completed Sales"... 30 days I think). One went for $300, one went for $500, and one went for $610. The $500 one was the "A" model and the other two were straight 180's.

I saw that on eBay. I was going to post the reference for you.

Nice to know it is 'TESTED' though.

BTW: I've been watching for a Johnson Ranger. One is listed with a buy it now price of [are you ready?] $1000.00 !!! for a 30 watt AM radio!!!

YIPES!!

Wait till he tries to find a replacement for the temperature
compensating capacitor in the Ranger VFO. It was the failure of that
part and my inability to find a replacement for it 35 years ago that
caused me to sell my Ranger. The Ranger was a nice rig, but $1000?

Of course the Ranger was advertised as a 75 watt radio, but virtually
every transmitter was rated by input back then (plate voltage times
plate current, key down.) Slightly under 50% efficiency was pretty
good. I think my first transmitter, a Heath AT-1, rated at 30 watts
(or was it 25) only put out about 7 watts. We didn't even have a QRP
hobby then. I guess I was ahead of my time in 1956 as a 13 year old
Novice. Its amazing what I actually worked with that rig...and a
Hallifcrafters S-38D for a receiver. I think the bandwidth on that
was the entire Novice Band. No wonder I had very good pitch
discrimination to sort out CW signals. I couldn't do that today.
Mercifully, I got a better receiver the next Christmas...a Hammarlund
HQ-100 (The HQ 180 was a couple year away, and I couldn't afford one
as a teen anyway.)

I think I got $50 or $75 for the Ranger when I sold it back then. The person who bought it, a lady EE, said she could fix it and when she couldn't, wanted me to take it back. Sheeesh. If I could have stored it for 35 years, I probably should have at those prices. I didn't.

Well If you like those radios I have a NARCO 12 channel "Coffee
Grinder". I don't remember the model number and it is my shop attic. I
think it is an ADM 3 or something like that.
But you can have it for postage. If you want I will check the model number.

eBay's a pretty true arbiter of popularity and true market value. It doesn't, for example, inflate the price of pieces of art at all -- in fact, there are many true bargains to be had. The same is generally true of cars and motorcycles.

Just because some idiots are willing to pay more than full retail for brand new, commonly-available items is not an indictment of eBay, but of the ignorance of those buyers.

The same is true for ham radio items -- there's a comparatively tiny population of interested parties, and no sophisticated network providing an accurate compilation of recent equipment sales prices. Vintage items are truly worth whatever someone is willing to pay.

I think it may be mostly because of me that it is "tested" at all (if in fact this is the same radio).

When I spoke to the owner at the hamfest, he said he hadn't ever plugged it in or turned it on since he bought it (from which I interpreted that he probably hadn't had it for very long). I told him I wouldn't necessarily be unwilling to go his $450 asking price IF I could go to his house (about a 1.5-hour drive from my house) and test it with a wire antenna or signal generator, and I asked him to call me if he didn't sell it at the hamfest.

It sounds like he probably took it home that night and plugged it in and tested it, and (I assume) found that it worked.

I suppose I should have just taken my chances and given him the $450... :-\

(I am kind of holding out for an "A" model, though...)

It'll be interesting to see how the auction progresses. If there is no shilling involved (big "if", I know, but I'm willing to give the guy the benefit of the doubt at least for now), either the radio won't sell, in which case I'll probably call the guy up and make him an offer, or else it'll tell me what the real market is for these things and I'll have to decide whether I really want to hold out for one or settle for something else like a Hallicrafters.

1057. Website for Hallicrafters

My first transmitter was also a Heath AT-1. I had 8 watts output on 10 meters. Worked WAS on 10 meters with that radio and it was crystal controlled on ~28.8 Mc [AKA MHz]. That was when WAS only required 48 states :-)

I was a little older than you when I got my license. Memory is foggy, but I was about 15 years old. My receiver was the National SW-54 [National's poor version of the S-38D].

Ah! The olden days ... today, IC-756P3, IC-746, AL-80B, IC-706 MKIIg, multiple antennas, retired [plenty of time], and rebuilding a 'nostalgia station', ca 1958-1960.

If you lived in W1-land back then, getting WAS on 10 would be a real
challenge...for the close-in states. From here in MD, getting Delaware
on the higher bands is a real challenge, even with short skip. I'm a
bit far for ground wave. For me a 10 meter WAS would have been easier
as a kid for all the adjacent states to Wisconsin (I lived right on
Lake Michigan) had areas far enough removed that I could get them on
short skip or sporadic E.
>

I don't think I ever saw an SW-54, but it was indeed their version of
the S-38 line. On ten meters the challenge woud be which of the image
frequencies you were actually on. I think the IF was at 455Kc
(Remember Kcs ???) My FCC tests were all in Kcs until I went for
Advanced and Extra about 15 years after I got the Novice and General.
I was just 14 by a few days when I took the General test and in those
days you didn't get Algebra until 9th grade. I had just finished 8th
grade when I took the test. You had to calculate a whole bunch of
formulas. I remember my 8th grade shop teacher who was my "Elmer" then
trying to tutor me in enough formula manipulation to do the test. He
must have done well for I did pass it on the first try. You also had
to memorize some schematics and draw them out by hand. The code test
was in a big echoey Civil Service exam room in the Milwaukee Federal

Court House...you could hear each character twice. I froze during the first part of the five minute code test, then finally settled down enough to perhaps get one clean minute. To this day I believe that a kind-hearted FCC examiner passed me because he didn't want to see a kid crying in the room. I was the youngest one there by a long shot. I think he knew I really could do the required 13 WPM. Fifteen years later, now living outside Washington DC, I went to FCC HQ there for the test with headphones for the CW exam. I went to take the Advanced exam, but the examiner had to give an Extra CW test first. He asked me if I could do 20 WPM (I had an ARRL certificate for 30wpm) and I said sure. So he told me to take the CW test, and if I passed it and the Advance test he would give me the Extra test (for which I had not studied at all...didn't even look in that part of the License Manual). I passed the CW and the Advanced with no problem so I took the Extra test cold turkey and missed it by one question. After the test was graded, I took my license manual into the corridor of the building and underlined the parts of the test I remembered. Thirty days later, I got a perfect score on the Extra exam. No crying that time.
>

>1958-1960.

I've thought about that. I do have a Hammarlund HQ-145 here in good physical condition, but with a likely bad tube. I did get it working once but the power supply capactors started smoking. I've put some new ones in. If I ever saw a decent Johnson Adventurer at the right price, it was my 2nd transmitter as a kid, I'd get it.

Today, still rather spartan here. An IC-751A to a Butternut vertical in the backyard and a couple of VHF handhelds and a base station. I only use the handhelds when I go back to my Wisconsin hometown and talk with the guys still there who were my teen ham buddies. They were all a bit older than me. When I was licensed, I was supposedly the youngest ham in Wisconsin. That distinction was soon eclipsed by a nine-year old in my town who 15 years later became my brother-in-law (we married sisters.) I mostly operate CW and have 160 DXCC countries with this modest setup.

Jon Teske, W3JT (ex K9CAH, W3DRV and I also hold KG4TJ from Gitmo Bay, Cuba where I operated in 1995.

Also keep in mind that eBay is an international marketplace. With potentially thousands of eyes looking at your item, there's a bigger chance that one or two people might decide that they just can't live without it. As opposed to a hamfest or swap meet, where it may be seen by a few hundred people at most, and perhaps none of them happens to be interested on that day.

I have found some info about the Ranger having rivited tube sockets
not making a good chassis ground connection. This can cause symptoms
like I am having. It seems the problem only occurs after the 6146 gets
heated up well. There is some possibility that the clamper tube (6AQ5)
may cause this also if it is not functioning correctly. I notice that
when this starts, I can put the VFO/Crystal switch in the "Zero"
position and the final current will drop to a low level. Any other
position it will continue to climb until I turn off the power.

Hi,

In addition to changing out the 6AQ5 clamp tube,
I would check the value of the 11 K resistor
(3 parallel 33K resistors)
at the 6AQ5 screen - mine had changed value to only 6.8K.

I replaced them with three 2W metal film resistors.

73,
Ed Knobloch

For the past two days I have attempted to download the manual for the Heathkit DX-60B from BAMA and the mirror site.

I have used IE7, Netscape 8.1 and Netscape 7.1.

I do not get any successful downloads. I get an error message and the file is less than 1K.

I have previously downloaded manuals for numerous receivers in the Hammarlund series.

Anyone else having trouble? Or, what have I missed or what am I missing?

I was able to download a manual last night, maybe around
3 AM local time and it seems to be working now (about 4:30PM
PDST). I did have trouble with BAMA a couple of days ago. I
suspect it gets overloaded.

Message-ID: <QsGdnW-RvcQDlp_bnZ2dnUVZ_tLinZ2d@velocitywest.net>
Source record: 8523

Hi,

Somehow I ended up with a pair of JVC/Nivico "walkie talkie" transceivers, Model TCR-125. The manufacturing date is 6/62. To some, these qualify as antiques. The radios are serial numbers 1308 and 1309, and are complete with leather cases. On a scale of 1 to 10, I'd rate them as an 8 or better.

While they are in good physical condition, I put batteries in them, and they don't seem to work...probably dried out caps. One of them hisses faintly and I heard voices on it. The other crackles when turned on, but is otherwise stone quiet.

I'm sure somebody on in this group collects old transistor gear, and I'd like these to find a good home. If you are interested, make me a fair offer, or I'll consider something in trade....tubes or variable caps, for example.

You can contact me at hpf at-sign gainbroadband dot com

Source record: 8525

Hi Pete:

They sound like old 11 meter walkie talkies. The hiss is from the super-regeneration. They can be converted to 10 meters by substituting a 10 meter crystal for the 11 meter one in there and retuning both the transmitter receiver. Generally, that takes only one coil adjustment on each. When the band is open, you can hear a lot of signals.

They will be under 100 mw.

YOu've got the wrong newsgroup.

There is rec.radio.amateur.misc and perhaps even rec.radio.amateur.policy
and now even the moderated rec.radio.amateur.moderated. Two or three
groups should be enough for that sort of discussion, but you see fit
to come to .boatanchors and post this here.

That despite the fact that it's been months, if not longer, since you
actually posted something on-topic here.

Mr: Black:
Your opinion is noted, and given all the consideration
it is due.

Follow-up to a letter I received:

----- Original Message -----

Subject: RE: Diamond Terrace

Thank you kindly for your reply.

> A brick terrace (not a walkway or side walk) of this type are used
> extensively by many universities and organizations for this purpose and it
> is popular with radio amateurs as well.

If my understanding is correct, names will be on bricks which
are to be walked upon. That many people participate in this
latest fad in memorials does not make it a "good" practice.
Millions of people smoke. That does not make smoking "good."

I'm happy to report that, at least in some quarters, this
practice is being rejected and the bricks are being used in
creative, attractive fashions that do not include teenagers
wiping filth off the bottom of their shoes on the name of
your loved-one.

Placing the name of someone we claim to respect under the
unavoidably dirty heel of passing observers simply begs credulity;
I am astonished that anyone finds this acceptable and, frankly,
I think it has it's roots in worshiping the false "heroes" of
Hollywood and their "Walk of Fame." I find it fitting in
Hollywood's
case, but not for my Elmer (or my father, or anyone else
I respect). Basing something as meaningful as the memorial you
propose in something as meaningless as Hollywood
defiles the very idea of a memorial.
You folks will, of course, do as you please.
And I'm nobody.
But I'm a nobody who's going to speak out against this
terrible dirty-ing of people we claim to value.

Respectfully,
David Stinson AB5S

I have observed prices on Ebay and elsewhere,
and they have been steadily rising for excellent
condition 180s -- the 180C goes for slightly less,
which is interesting, because I started on a
180 and thought it might have better sensitivity.

But I say again -- excellent 180As and especially
180AX version with no major marks on the cabinet
or front will continue to rise...

Dear All,

My kenwood TL922 has developed a strange fault. When I switch it on (via an Ameritron Soft Start module) I get a negative reading on the Ig meter of -50mA and a positive reading of around +100mA on the Ip meter with no key down.

Keying the amp has no effect and the relay does not energise. I have checked the ALC and relay connectors and the coaxial cables

I've tried starting it directly bypassing the soft start box and this has made no difference. Obviously I do not leave it on for more than a few seconds as there is clearly a fault. I have had the covers off and can see nothing untoward in terms of burnt components and there is no burning smell and the fuses don't blow. Also both valves (3-500zs) light up.

Any suggestions as to what may be up before a trip over to Castle, has anyone else seen similar

thanks

Easy diagnosis: one of the two 3-500Z tubes has developed an internal grid-to-filament short (quite a common fault).

The short causes the tube filament to effectively stay at ground potential even during stand-by, and that is the reason why the tube conducts and the plate meter then shows some idling current.

The grid shows negative current because, due to the short, the positive DC voltage applied to the filament to keep the tubes interdict during stand.by founds a path to ground through the grid.

WARNING: you are running the risk to blow the service transformer (T2). This is a Kenwood design fault: when a grid-to-filament short occurs, the 80 Volt generated by T2 is shorted to ground. DO NOT SWITCH THE AMPLIFIER ON AGAIN until you have replaced the faulty tube.

Jim, I agree with Antonio's diagnosis of a shorted tube. However, you can also post at http://groups.yahoo.com/group/ham_amplifiers/

The Yahoo amps board is a good place to ask for info about improvement mods for the TL 922.

I'd also recommend the amps reflector. There are a lot of very
knowledgeable people on there.

You have described the classic symptoms of the heater-grid short inside the 3-500 [at least one of them].

The heater is tungsten. Tungsten grows crystal 'whiskers' over time. It is well documented physics. These whiskers are thin as silk thread [or thinner]. In many instances they can be removed with a simple application of 110 VAC between the heater and the grid. Some people will charge a 10 uF capacitor to several hundred volts and discharge it into the grid/heater short circuit. This will 'cure' the 'whisker' issue [pop the fuze] in about 90% of the instances.

A second option exists. When you first power up the 922 don't panic over the current being drawn and jump to turn it off. Wait for 10 to 15 seconds to see if the filament heating and resultant thermal expansion will eliminate the short for you. [This is much less expensive than buying a matched pair of 3-500Z's]. I have been running my AL-80B with a transient [heating] grid/heater short for over a year. Once the transient state has returned the circuit to normal operation, the amplifier works 100% as designed. [BTW: I have a spare 3-500 that I will use if the short eventually becomes a 100% hard failure].

Very dangerous with the TL-922. Due to Kenwood design fault, the 80V service voltage gets shorted to ground when a grid-to-filaments occurs. After a short while the service transformer (T2) will be permantly damaged.

Agreed. However, sometimes shock and vibration can rattle the whiskers
off the grids. Pull the tubes and let them roll around on the floor of
your car for a couple weeks; this may help you get a little more lifetime
out of them.

Be really careful with the things, though.... the transformer damage issue is a
big deal.

Hi Dave

Wouldn't the 15 second run burn out the filament supply transformer though?

Thanks Tony for that information. I was unaware of that design in the 922. I run Ameritron stuff.

But, poping the fuze is still worth a try. You do have to remove the 3-500 from the amplifier to pop the fuze.

I'm not aware of the 922 design details that contributes to the 'transformer' issue.

The normal filament current is about 14 amperes at 5 volts. The grid/filament short generally draws less than 100 ma of grid current and less than 300 ma of plate currnet. An abnormal current of less than 0.5 ampere is not a problem for the major floating secondary winding of a filament transformer.

The design of the bias circuit can be a totally different circumstance. In Ameritron amplifiers it is a self bias through a series of resistors and/or zeners. My Al-80B uses about -15 VDC as cutoff bias. In the 922 ... I have no data.

Restated, remove the tubes and 'pop the short' if there is a concern in the 922.

In the TL-922, the filament transformer would burn after a short while because on that same transformer there is another secondary (80 Volts) which gets nearly shorted to ground when a filament-to-grid short occurs in a tube.

OK, I found a NOS RCA JAN 6146 this morning at the Weatherford Hamfest. Put it in and its working fine now. The 6146 was bad or the Ranger sure didnt like that 6146B model in there. Got it all going now. Thanks to all for the suggestions.

1110. Suggestions for tube-type general coverge rcvr, not HQ-180

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-03-25 01:01:37 UTC
From: Rick <Nospam@reply.in.gp>
Message-ID: <pan.2007.03.25.01.01.35.475456@reply.in.gp>
Source record: 8456

Well, I am beginning to have some doubts about the likelihood of finding an excellent-quality Hammarlund HQ-180 at a price I can afford.

Certainly I am going to keep looking, but meanwhile I guess I need to come up with a few alternatives that I can "settle" for if, as seems likely, the HQ-180's have priced themselves out of my reach.

I need something that is all tubes, and works well on SSB. I plan to use it mostly on CW but I need decent SSB performance. AM is relatively less important (it should work on AM but doesn't need to be a spectacular performer).

It does need to be general coverage 500 KHz to 30 MHz.

R390's and 51J4's would be good (but of course, more expensive than the HQ-180) but none comes with a product detector and so performance on SSB is likely to be marginal at best, right?

I have looked at a few Hallicrafters SX-100's (that is to say, looked at their pictures on eBay... haven't actually seen one up close in at least 30 years). How does that model and other comparable models from Hallicrafters and National stack up?

Did Heathkit ever make a general-coverage communications receiver that was worthy of the name "communications receiver"? I know they had one, I think the model was AR-3. I had one when I was a kid and it wasn't much. Everything else I've seen from them seems to be ham bands only, and mostly 80-10 (no 160).

Any suggestions, places where I should start looking?

1111. Re: Suggestions for tube-type general coverge rcvr, not HQ-180

Rick,
I'd say the best peformance for your buck would be
an R-392, but it doesn't have a product detector.
I've never had a problem tuning in SSB on mine though.
Another rig worth checking out is a Halli SX-122.

Finding a tube rig with a product detector, general coverage,
and for a decent price is getting tough. A friend has asked me to
look for an HQ-180 (preferably a 'C'), and prices have
been astronomical.

Steve

The SX-100 is beautifully built and nice to look at - but it is mechanically unstable. A friend had one and it changed frequency when he dropped his pencil - when on 20 meters cw.

For cw and ssb, a crystal controlled front end is a big plus. You have the same stability on 10 meters as you do on 80.

Here are a few relatively inexpensive receivers which I like:

Drake 2B (you do not have complete coverage - just selcected bands. However, you can change crystals.

Drake R4. Very good buy. However, you have to add crystals for full coverage. You can also use an oscillator to replace the crystal.

Hallicrafters SX-117. Again, you need extra crystals - but it is a nice performer.

Racal and Eddystone makes some real tube beauties. Although the early ones do not use crystal controlled front ends, they are quite stable.

The SP-600 is also a favorite, although no product detector.

For short wave listening, push pull audio is nice. But, that feature does not mix with product detectors or crystal controlled front end.

Do like others, and buy many receivers.

73, Colin K7FM

If you really want a lower limit of 500khz you will be pretty limited. If you mean just the bottom of the broadcast band (535khz) there are plenty.
You might consider using a receiver with a built-in IF output and building an external product detector. Product detectors are not very complicated. It will give you superior performance for CW as well as SSB. There were a number of after market adaptors made but the good ones are very rare. A homebrew does not have to be as complicated as the commercial versions. There are circuits in old editions of the _Radio Amateur's Handbook_ and other places. Perhaps even on the web.
Don't eliminate the SP-600-JX from your list, it has both IF output and an AVC tap on the back so you can connect its internal AVC to an external source. A very good external adaptor was made for these guys but its extremely rare.
There is a lot of literature on the SP-600 on the web, I suggest educating yourself about the various versions if you decide to look for one.
You might also check on some of the later National receivers, they, with Hammarlund and Collins were the quality brands. Hallicrafters was good at producing receivers with lots of features at relatively low prices, most of them IMO, were mediocre.

When the service started up in 1959 or so, FCC issued callsigns that began with the number of the FCC District where the licensee was, a "W" or a "K," and 4 digits, for example, the TV shop in Detroit I worked at as a kid had a base station callsign of something like 19W3091, and our trucks ID'd with that call, plus Unit 1, 2, etc. I don't remember if there was any restriction on the number of "units" that could go with a base license. They had to scrap that callsign system as it did not comply with ITU convention- US calls have to begin with W, K, N, AA-AL, and not a number. This was an issue as someone apparently didn't consider that propagation could carry CB signals across international borders, so the ITU regs applied. The radios came with the FCC license application form that carried a warning to not use the rig until the license had been received. Later on, before they finally gave up on CB entirely, the FCC issued licenses with 4 letters (properly US-prefixed) plus 4 digits, like KBNF2675.

I used to manage operations for the military that used R-390s in vast quantities. It was not uncommon to have over a hundred of them at a facility and thousands in our overall inventory. For what they were designed to do they did a great job. As is mentioned they did not have a product detector. I once saw a prototype sideband adapter, but before it was adopted in any number, we went to newer solid state receivers (none in the ham price category... 10K each and up.]

There were a couple problems we had with R-390's. The main one was maintenance. The tuning scheme was so complicated you practically had to be a mechanical engineer to fix one. The gear trains to control the permeability tuning are a wonder to behold. They were cumbersome to tune and military intercept operators who used them all day long complained of "R-390" wrist because it took so much arm torque to change the megahertz dial. It was time consuming to get from one end of the spectrum to a different end. Some guys, particularly HF search operators got carpal tunnel from tuning them day in and day out. They consumed a lot of energy, particularly if you had a bunch of them operating at the same time. We usually had air handlers to cool the rooms they were in. The only reason they didn't drift is because ours were on all the time.

I was the program manager for programs which used a bunch of these, and as such I didn't use them day in and day out (I did use them some, but not as a day-to-day operator.) I also didn't have to fix them myself, but I oversaw the programs that made sure there was someone there to fix them. The criticisms I heard were from the military ops and the maintenance guys. We reduced our maintenance overhead in personnel and spare parts considerably when we finally got rid of them. We could afford to buy 10K receivers because we didn't a ten man maintenance shop on site to keep the R-390s (among other gear) going. Of course in the end, we had to get rid of them because there just weren't parts available in the quantities we needed. They were used for long after government contracts for manufacture and for spare parts production ran out. I've been retired now seven years and the last 15 or so years of my career we didn't have any R-390's on my projects (there probably are some still in the government through, if only in depots.) I saw my last operational SP-600 series in the early 70's. The search operators loved it because you could scan a large chunk of spectrum (before automated systems) in far less them than with an R-390 or 51J receiver. The 51Js were all gone by the time I started in 1964. I don't think I ever saw one operational.

Of course a ham restorer dealing with unit quantities doesn't have the maintenance management problems we had because a ham trying to fix up

one or two can probably scrounge up the parts or cannibalize another like units, but we had to look at the R-390 and almost any other piece of gear the military used in terms of life cycle support, personnel costs, training tails, depot stockpiling and a host of other issues. It was a good receiver that just wasn't supportable anymore. The same could be said for the SP-600 series which was actually obsolete when I entered the profession 43 years ago, but that hasn't stopped dedicated hams from making them work in unit quantities.

I agree about the stability of the SX-100. I brought a new one home
back in 1956 or 1957. The first thing I noticed was the instability
of the oscillator. The SX-101 is a much better and more stable
receiver (and a lot heavier.)

Three letter prefixes were issued after those early numeric prefixes.

I was KQA4923

Later, I was KEV4927

They didn't seem to use strict letter/numeric order...

Rick,
Owning not a few receivers in my current collection, including all those spoken of, so far, let me first agree with many of the comments, including those about the SX-100. Its a beautiful looking receiver but not without its foibles. A truly nice R-392, SP-600, R-388/51J, et al currently appear to demand what an HQ-180 would, or more. I'd like to add to your list the Hammarlund HQ-160. Its not a selectable sideband receiver, per se, but it is double conversion, general-coverage and, arguably, a less expensive substitute for the HQ-180. I have a late, raised-lettering version that works quite well with one of my vintage operating positions. I have tried several outboard product detectors with this receiver, to include the Hammarlund HC-10, the CE Sideband Slicer, and the kit detector from that Canadian fellow. They all work, although the price of an HC-10 approaches the base price of an HQ-180A!!! I'd also bet money that you might find yourself liking the HQ-145A, also a general-coverage, double-conversion receiver with very respectable performance. Nice thing about later Hammarlund receivers is that they didn't use many (if at all) paper capacitors. Finally, FYI, Heath never made an upscale general coverage receiver. Good hunting.

Hi Jeep

The SB-310 was perhaps the best SW receiver they made.
Albiet limited coverage... It did a PD if I recall...

Dear All,

Update:-

Had the case open and indeed 1 of the 3-500zs was showing a grid/fil short, however a little inadvertent rough handling cured this and when reassembled the amp worked fine for an hour or so. Then it was switched off for lunch and after lunch the problem had returned and this time is persisting despite removal of the valve. I haven't yet tried the mains blast across the pins as I'm not that confident!

good news is that the filament transformer seems fine and hasn't been apparently damaged by the few very short excursions into short territory.

A new valve will be ordered. May try the whisker zap if feeling brave at some point

Learnt a bit today, I now have better understanding of the innards. Interstingly the previous owner had done some but not all of the Measures mods, e.g. cathode and low Q VHF parasitic suppresors.

thanks for all the advice

The 6SN7, being a dual triode with all elements pinned out separately,
would need all 8 pins on the octal base. On metal tubes, pin #1 was
always reserved for a connection to ground the metal shell.

There aren't enough base pins available to make a metal 6SN7 possible.

This is mostly a myth. I had an SP-600 for years, and never had problems
receiving SSB. You just turn down the RF gain, turn up the audio gain
to compensate, turn on the BFO and tune away. The issues of using
such receivers for SSB date from the very early days, when people didn't
understand how to do it, and so they were disappointed. Obviously, some
cheap receivers did have problems, because even with the gain turned
way down, the BFO wasn't strong enough. But that's not likely the case
for the better receivers.

The limitations would be in whether the dial allows for fine enough
tuning (which will likely be fine in those receivers) or lack of selectivity
(which won't be a factor with those receivers, and doesn't actually affect
SSB reception, just affects how much other clutter you do receive).

Having a product detector did make it easier to tune in SSB signals, making
the process less cumbersome.

This is an understatement. If they'd given thought to propagation, they'd
not have allocated 27MHz to a band intended for local use.

Even with nobody working skip, when the skip was in the band got cluttered.
You couldn't avoid propagation getting those distant signals to you, and
that did not help the intended use of the band.

OM,

Thanks for the information.

I've sometimes wondered about earlier versions of Hammarlund receivers:
as a VE, I get questions about "low priced radios" all the time from new
or upgraded hams, and I'd like to have more information on the
Hammarlund line.

Please provide your list of the various Hammarlund receivers and their
good and bad points. With the flea market season starting, this would be
really nice to have while looking at tailgates.

Thanks in advance.

William

One of the ones I always wondered about came in the sixties and I'm
pretty sure was still in the catalog in 1971 when I would have seen
my first Heath catalog. It was a general coverage receiver, and looked
a lot like the average low end receiver. But it used an IF in the 1600KHz
range, using a two-crystal lattice filter. I've always been curious
about it because of that high IF which obviously would make an improvement
for the highest band in terms of image rejection compared to the usual
cheap SW receiver. But I've never really seen anything about how the
receiver was generally. A higher IF suggests something better, but
it might have just been as bad as the usual low end SW receiver.

Michael

I believe my old HR-10 used an IF of 1680 kc with a simple
2-pole lattice filter. Of course that was ham coverage only..

My vote would go to the Drake R4A or R4B.

I've used many of the radios discussed here & many modern rigs as
well. The Drakes are excellent performers.

Crystal them up for your SW freq.'s of interest or add a freq.
synthesizer if you don't want to bother with crystals. There were
construction articles in June 2004 QST & ELECTRIC RADIO Dec 2005 to
build your own freq. synthesizer.

I've got the R4A & it's one of my favorite radios. Great on SSB & CW
as well as AM.
Four selectivity positions , .4 kc, 1.2 kc, 2.4 kc and 4.8 kc ; pass
band tuning, etc.

The copper chassis are prone to tarnish but it doesn't effect
performanace.

I currently own the following tube type receivers/transceivers: R4-A,
R390A, HRO-50, HQ-160, KWM2-A, Hammarlund Super-Pro SP-200.

I have owned over the years Collins R-388 & 75A-3, National HRO-60,
Drake R4-C, RCA AR-88, Hallicrafters SX-100, SX-101, SX-115, SX-117,
SX-122, SX-42, Drake TR-3 & TR-4.

I've also owned or used much modern equipment including many rice
boxes & Ten-Tec gear.

Yes it did. I was even going to say that the shortwave receiver I
was talking about might have been a variant of that ham band only
receiver.

Michael,

I don't feel it was a question of propagation: the FCC wanted to create an inexpensive radio service that could be used by those who could not afford the standard "two-way" radios that were available at the time.

The problem, in a nutshell, was that tube designs for VHF and UHF were very expensive to manufacture, tune, and repair. I think the idea with the class C & D Citizens' Bands was to make the rigs affordable _using the vacuum tube designs of the day_, and that meant keeping the frequencies low. Since ham operators had an assignment at 10 meters, and the primary user of 11 meters (Medical Diathermy) wouldn't be affected, it probably seemed like the ideal spot: the only commercial allocations near it were in the 30-50 MHz range, but assigning a new service there would have meant displacing existing FM licensees, including many local government users, who were _also_ interested in keeping their radio costs down.

Don't forget: the class A & B Citizens' Bands had been authorized for many years, with dismal results: since class A & B CB radios used 460 MHz, users had to pay for the same Motorola or GE or Johnson sets that telephone, utility, taxicab, and others with deep pockets were using.

Long story short: experience had shown that the cost of UHF units was too high a barrier for farmers and other rural users, and IMHO, _that_ was the reason for choosing 27 MHz.

YMMV.

You can use a charged cap to "blast" the short, might be less
dramatic than the unlimited current behind the mains.. This
sometimes vaporizes part of the grid structure and affects
tube operation..

Re: Early Hammarlund Receivers:

The pre-war HQ-120 was a modern bandswitching general coverage receiver. They are not bad. 455 kc (pre kHz) if and rf amplifier. They were fairly good. The problem with Hammarlund was that they continued on with design for the next 20 years and while others went to dual conversion, more selectivity and product detectors, Hammarlund continued onward with the same design.

These designs were the HQ-129X, the HQ-140 and even the HQ-150. They all work well for a 1938 design. Later, the HQ-100 continued on with pretty much the same design, in a more modern package. They are not bad receivers - but they are simply in a different league compared to the Drake R-4 series. The HQ=100 replaced the semi-useful crystal filter with a next to worthless Q multiplier.

None of the Hammarlunds mentioned are in the same league as the HQ-180 or the SP-600.

You may want to get a copy of "Shortwave Receivers Past and Present" by Fred Osterman. It is excellent.

Some inexpensive sleepers might be some of the National receivers. The NC-2-40 C and D are quite good. They, along with other National receivers, have push-pull audio and are good on broadcast stations. Some of the later National receivers have not impressed me. National also made some WW II receivers which are under appreciated - the RAO series. Many of the older receivers require replacement of the paper caps, but are mechanically stable. They were used shipboard 24 hours a day. Dependable workhorses.

You're thinking of the GR-54 model which has a 1682 KHz IF frequency.
Tuning range is 180-420 & 550-1550 KHz and 2-30 MHz (notice the
coverage gap between 1.55 and 2 MHz). I bought one in the fall of
1966; price was about $85 US + shipping.

Quite sensitive and, with the high IF frequency, images are a non-issue
unlike the
typical low-end 455 KHz receivers so definitely a step up.

Mine still works but sits on a shelf in a closet. With no digital readout
it's
just too hard to find anything on the not-too accurate slide rule dial.

Regards,
John

I remember medical diathermy in the 50's being an important cause of
TVI. They apparently were available for home use by patients. I never
needed one so I really have no idea what they were supposed to do.
To they still exist? Have they been replaced by a different
technology?

Hallicrafters SX-122 or SX-122A. Nice 50 KHz last IF
with selectable sideband and appropriate AGC.

OTOH, It's not that hard to do single-signal CW and SSB
with an R-390/391/392 on the 2 KHz bandwidth setting.

Many receivers without product detectors will do OK on SSB but the problem is having to run at low RF gain and having no AVC. My SP-600 does OK but I got better results with my old BC-779 (SP-200 Super Pro) because the BFO injection is isolated from the AVC and is greater. I don't know why Hammarlund did not adapt this method to the SP-600 but it is only one of several puzzles about the design. BTW, I have never understood the need for adjustable BFO injection on most SP-600 models. The books suggest running it at maximum but that results in tube overheating of the buffer and some oscillator pulling. I set mine so that the tube bias is "normal" for maximum amplification, 1 volt measured at the cathode with the BFO off. The JXZ-17, which has fixed injection, runs at this bias level.
There are many approaches to building an SSB adaptor. In many cases they can be made to be plug-in with no modification to the receiver. A great many designs were published in QST and CQ magazines beginning in the mid 1950s when SSB was becoming popular.

Hi there,

I am looking for GF-11 transmitter low frequency plug-in coil:
CW-47135 (2000-2500 KC) , or other plug-in coil for slightly lower
frequency, which can be adapted for 160m band. I do have spare coils
for 40m and 80m bands for trade.

Also looking for power supply 9-pin connector.
Please reply directly to: kb9olm AT yahoo DOT com

73,
Vlad, kb9olm

Does anyone have a service manual for this rig? I
downloaded two off the web and neither has the
schematic for the RF board with the voltage readings
I need!

73, Roger

What is the problem with this TS-930 ? ?

I just repaired one of these heavy solid-state boatanchors.
And I need the service manual also, but have most of the schematics.

I replaced the RF PA drivers (NTE236), power supply pass
transistors (2N3771),
re-worked the cooling fan circuits.

There was a military sideband adaptor available using sheet-beam tubes,
although I forget the nomenclature. There also were a lot of civilian
models that will work as well.

They are phenomenally stable by the standards of the day, and the short
term stability is actually better than some PLL receivers today.

The audio quality is pretty bad, though, and the mechanical filters
on the 390A that are a godsend for pulling signals out of the noise floor
also contribute to severe ear fatigue because of the enormous group
delay. I get a headache listening day in and day out.

The good news is that Chuck Rippel's shop down in Chesapeake looks like the Ft. Devens radio refit facility did thirty years back. He has racks and racks of 390s in for repair, and he has all the special tooling and jigs for module testing. So you still have the depot level support that the military provided, it's just that Chuck is providing it now.

Actually there were some cheap two-tube units out there, which used
a single device as a regenerative detector or as an oscillator, combined
with an audio amplifier tube. The performance was very poor, however.
"Vocaline" was the manufacturer that I remember.

Do you mean large cassette, or do you mean cartridge? Do you mean
the 1/4" cassette format (for which no commercial machine was actually
released) or one of the 1/4" continuous loop cartridge formats (which
look like broadcast carts but are larger)?

I remember hearing about the Ft. Deven facility. I was never there,
but most of the Army GI's who worked for me trained there. As I worked
with all of the services, I got guys who came from all the schools,
Devens, Pensacola, Goodfellow and others. They seemed to have
different syllabi for training, often contradictory. I was the Program
Manager for the overall project and I didn't have specific
responsibility for the guys who actually worked in the maintenance
shops. My job was really to see that there WAS a maintenance shop and
that someone had responsibilty to train the folks and staff the
facilities, so it was far more political than practical. Since I had a
ham ticket and the guys in the shop knew that I knew which end of a
soldering iron was hot, they cut me a lot more slack than they would
with the average "suit" who came in from Washington. I tried not to
say "We're from HQs, we're here to help you."

Is Chuck Rippel in Chesapeake VA????

I went through similar replacing the RF PA drivers about 15 years ago. One thing to watch with the PA circuit board is the holes that are plated to connect the foil on one side to the foil on the other side. The plating may fail resulting in a bad connection. This happened with my TS-930 with the bias circuit of the drivers which resulted in failure of the drivers. A small wire through each hole that is soldered on both sides has kept my TS-930 problem free since.

having trouble with this, and have the brief instructs from io.com,
which i think are from the hro 50 instructs. have removed two set
screws which are accessed thru a hole in the black knob part of the
dial. turn the dial to 250, and have some play -- it moves back and
forth on the shaft for about 1/16" of an inch but does not come off.
reluctant of course to pull hard. there does not *seem* to be a catch
or some way to release from the back side, nor any other screws.

this is a somewhat unusual set of about nc-100 vintage (1939-41-
ishmade for precursor to FAA). has the sliding coil tank, and
receives usual shortwave bands plus an old airband. knob is black,
dial is grey. can't get the faceplate off for redo until dial knob
removed.

have original docs, but instructs for this not given there. bama, etc
no go for further docs on this unit.

I recently completed 3 a.c. power supplies for the Chinese Army 102E/XD-6 radio set, one of which is extra to my requirements. It runs on 115/220v, 50-60Hz and provides the isolated 90v DC for the receiver as well as a regulated 1.4v for filaments. It also provides 500v and 6v DC for the transmitter. Full schematic, parts list, and circuit description are included. It utilizes a new Hammond power transformer. The cost will be $165 plus shipping for about 16lbs. If anyone should be interested, drop a line. As an aside, this supply will also power a GRC-9 or BC-1306 with no mods, whatever. You will, however, have to use your own 102E power cable. The schematic and interconnect wiring diagrams have been scanned, if any of you 102E owners would like to have a copy. de K3HVG

When you say 'commercial' are you excluding consumer machines? These weren't common, but they did exist. My dad had one in the late 60's that he bought used. It had 1/4", mono, double-sided, double-hubbed (R to R) cartridge, roughly seven inches by maybe five inches. Tape ran at 3 3/4 ips.

I'm not aware of a stereo model, but would imagine it to be half-track....

Further research indicates that RCA did indeed introduce the format in
stereo (1958). Speed for prerecorded cartridges was 3 3/4, but some
recorders also had a 1 7/8 ips option. Word is that the stereo machines
are now rare and somewhat expensive. There's a mono(?) version on eBay
right now, starting bid: $29.95

Well he is the most prolific seller of gear in the radio catagories. But I wounder if he makes as much as we think allthough I'm sure he does make a profit. I sell a fair amount on Ebay and it's a lot less than him and I'll tell you it's quite a bit of work really and if you weigh your time listing, answering email, packing, driving around a anything else? it's work. His philosophy is sell quantity, but at any given time he has thousands wraped up in stuff he's bought to sell.

Yep, it is an easy one:

First, clean everything up so it shines.
Second, write an interesting story about the item.
Third, take lots of flattering pictures.

If you do that, you too can sell for top dollar.

-Chuck

Ps. I learned a long time ago that the simple act of cleaning up the scum
off of hamfest equipment made it sell for a lot more. I sometimes went around
to other tables, bought something that was dirt crusted, and cleaned it off
and doubled my money.

I wrote an editorial about that for Comm'Quarterly many years ago..
How folks put dirty radios out for top dollar, and don't even
consider what a few minutes of labor would have done for
their potential sales and bottom line...

Bob: I think you must be correct! And come to think we used 6SN7s in
our three channel Lenkurt telecommunications/telephone carrier
equipment in the 1950s and I do not, now it is discussed, ever recall
seeing a metal one!

> Any suggestions, places where I should start looking?

I would love to have an HQ-180 also but they are just too pricey. I
did find a nice HQ-170 on Ebay and restored it. The HQ-170 is not
general coverage but I really like mine for general boat anchor Ham
use. You can check out my HQ-170 and Ranger on my Flickr site.
http://www.flickr.com/photos/wb5kcm/sets/72157594523189590/
It's not the greatest AM fidelity wise receiver due to the narrow IF
bandwidth but still does a nice job. You can pick up a nice HQ-170 at
hamfests for around $100 to $200 depending how pretty it is.
73, Randy

I just did some basic math on Martyn aka Radio-Mart and he has 8599 feedbacks in about 7 yrs and if we just average about $200 a sale that means he sold $1,719,800.00 and devide by seven adds up to 245K a year worth of radios and most of his radios I think sell between $200-2000 so $200 is low enough to account for his overhead too and we can probably safely say he made that??? His alias gottahaveit1995 has bought $41945.61 in radios from Feb 25th-Mar-20th. My point is why would Ebay want to get rid of a high roller like that. I wouldn't.

Alpha Bravo,

Your not going to like the answer....

There should only be the two screws (one screw on earlier HRO dials)
and the knob should slide off.

I had fits removing one a couple of years ago. I tried copious amounts of
thread lubricant and gentle twisting and tugging.

The end result was surgery - I had to crefully cut the bakelite knob
around the shaft to remove the pieces from around the shaft.

I found another HRO knob on Ebay for $15. The original skirt was left
intact and OK.

I also have a modified NC-100 for the Dept of Commerce. Fun little radio.

Source record: 8424

The self contained circuits containing resistors and capacitors were often used in the audio chain of receivers. Many schematics show the contents of the integrated circuit at the side of the schematic - but if not, it is easy to go to any tube design handbook and reverse engineer the components. As I recall, all of the RCA tube handbooks contain the elementary design data needed to determine how the chip should have been constructed.

Certainly not rocket science.

The bill to get the coffee out of my pants and keyboard is $27.62; I won't charge you for cleaning the monitor screen, which needed it, but coffee really isn't a recommended cleaning agent.

Has anyone ever tried *CAREFULLY* drilling a hole dead-center in the knob, and then using a gear puller to get the knob moving on the shaft? I realize that it risks damaging the skirt, if there is one, but at this point you're already at risk of having to cut the knob off the shaft anyway, and the additional risk of damaging the knob doesn't seem to be all that great -- to me, anyway; YMMV.

The skirt is actually the valuable piece if it is in good condition
The knob can be found through the usual sources.
Trust me, I thought about the gear puller. But it would cause more damage
than it helps

Hi,

I am parting with some (maybe much) of my equipment as life's priorities change. Listed below is the first round of gear, some of which I plan to bring to the Timonium, MD hamfest this weekend (3/31):

Collins 75A-4
Drake 2B, #10236 in almost pristine, unrestored condition
Nye Viking MB-V-A antenna tuner
Drake TR-3 and RV-4
TMC (Technical Materiel Corporation) XFK-2 FSK Exciter
TMC AMC-2108-50 rack-mount 8 receiver multi-coupler, clean but presently inop.
Millen 90651 Grid dip meter, almost undistinguishable from new
General Radio 650A Impedance Bridge
Weller EC-1302A soldering station
Astatic D-104 mike w PTT stand
Hewlett Packard 5381A frequency counter
Hallicrafters HT-18 VFO/Exciter
Hammarlund HQ-170A

I am somewhat fussy (okay... VERY fussy) when acquiring and caring for equipment and, consequently, most of these items are particularly nice. Just which items I bring will depend on just how much I can fit in my vehicle. If there is an item that interests you, let me know so I can plan to bring it. I'm not being coy but have not yet sat down to consider pricing although it will be quite fair. Delivery MAY be possible along the route between my home in western CT and the Washington, DC area. For information, feel free to call or e-mail me directly (NOT via the newsgroup).

1185. fixing crystal mic elements?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-03-30 01:52:26 UTC
From: Steve <zarco@sonic.net>
Message-ID: <460c6d5f$0$14078$742ec2ed@news.sonic.net>
Source record: 8431

Does anyone know of a method to restore old crystal mic elements? I remember someone mentioning this in the past but can't find any references to it.

Thanks!
Steve

If this is an old fashioned Rochelle salt type crystal
there isn't much you can do. This type of element is very
sensitive to moisture, it fact, it will partially dissolve.
The only cure is to replace it. I am not sure about the
newer ceramic type elements. I suspect they go bad due to
mechanical damage, again about the only way to fix it is to
replace the element.

yeah, thought about the gearpuller. i can't really see what's holding it on, but it does seem to be a problem w.the shaft. a guess is it has been cut up by one of the screws perhaps leaving a ridge or something stopping assembly from sliding off.

the assembly moves just fine and isn't frozen -- just won't move all the way off, or even very far outboard.

thanks for all suggests.

I don't know about the restoration process. But, I can recommend a new crystal element that is virtually indistinguishable from the old D104 in output and tone. They are made by Kobitone and Mouser stocks them (25LM024). The are only a few bucks each.

I have replaced many a D104 elements with them and have excellent results.

John, Beings that the L4B is a known quantity, so to speak, it should sell itself. Epay is always a starting point if you want to ship it to who-knows-where and pack it so it WILL arrive alive. E-ham and QRZ are also places to list it. If your price and condition are reasonable, you should have no problem, whatever the venue. Personally, I'd chose to keep the Drake.......

Check Hickok for an equivalent instrument. Stark was
their Canadian counterpart. It might be easier to find
the related Hickok manual for the generator...

I have the following gear that I would consider trading towards more "modern" gear. I have had these sitting pretty on the shelf for the last 7+ years and do not use them.

3 S Lines consisting of...

1. 32s-1, 75s-3, 516f-2, 312b-4, 30L-1

2. 32s-2, 75s-1, 516f-2 (some knobs on TX/RX not original(

3. 32s-1, 75s-1, 516f-2, 312b-4

All S-lines in good cosmetic and working condition when last used and have original OR replicated manuals.

A Line

32v-2, 75a-2 and accommpanying speaker

All of these A line components in fair cosmetic condx but need work electrically.

I am open to interesting trades towards modern gear to free up room in my shack. In particular interested in modern HF radios and/or amplifiers.

Please contact me directly at ...

Either the front end is not getting proper AGC voltage, or the detector
stage isn't producing it. What do you measure on the AGC line, and does
it change when you tune stations in and out?

For sale: German WWII medium/shortwave receiver M.W.E.c (Caesar).
This radio was used by German command tanks. Very sophisticated radio,
which covers 830 to 3000 kHz in 2 bands. Made by Telefunken in 1940.
9 tubes RV12P2000 (spare tubes available), double quartz IF filter
variable bandwidth, magnesium alloy construction (lightweight type,
very rare !),
about 12.5" by 8" by 7" , 15 lbs. This radio is in very good cosmetic
and very good working condition. The radio comes together with home
made power supply and original power supply cable. $2700. Will ship
continental US only.

I am not sure where the AGC line is in this radio.....I ordered
the service manual for this radio from ESSO last Friday.
The S-Meter is functioning, but still, I realize that this doesn't tell the
whole story. I am expecting to see a shorted AGC timing capacitor.
Once I get the schematic, it will be a little bit easier to muddle through
the circuit. For the time being, I am stuck.

Call To Arms, means, you will inspect your weaponry and prepare to do battle. Duty Stations, means, all men and women must assume their duty stations, weapons at the ready. Fire When Ready, means, man or woman your weapons, sight the target, finger the trigger, and fire when ready. Cease Fire Procola, means, continue fireing until the enemy targets are dispatched, and there is no sight of an enemy anywhere on the horizon. Procolas means, after ending all possiblities of any lingering survivors staying alive. It means to wipe them out, and leave no survivors.

This means, it is time to kill all Lesbianists, and all other enemies in my universe, the many groups of naughty kids in my universe, rascaleers and others, and we will continue this fight, untill they are all dead, and in my Epcot Centers, or untill they have surrendered. Rascaleers are evil people who wish only to harm others.

Religious Practices

This is a little confusing, but hold on, and I'll try to explain it. There are many parts to my religion. We call them, parts, but we can also call them, practices, some of them, but not all of them.

We have the fundamental 'root' practice, which is sexaling. From the root practice, comes all other practices.

There are side practices, and there are derived practices. There are also, accompanying practices. There are many other types of practices,

but I don't remember the names for them all, right now, as I'm still amnesiatic, and will be for a long time.

Fistiker Practice

Bringing about orgasming in another person is a fistiker practice. A fistiker practice is a side practice, but it is also something a little different from a side practice, depending on how you bring the orgasming about, and depending on how many people are involved, and depending on who is the primary person, the person whom we are working on, and who are the helping people, the people who are joined together, to help the primary person to orgasm. There are a number of other dependencies as well.

What Is A Dependency?

A dependency is some thing that is needed that will help to define something else.

As in the case of an accident victim, we have a crutch to define one level of severity of an accident victim's situation. But we might also have a wheel chair to define another level of severity for the same, or other, accident victim. These objects help to determine how badly or miserably a person is injured.

A crutch can help define a level of severity in the injury. A wheel chair can help also to define a higher level of severity. These are both dependencies. They help us to define something, and they are used to help us to define an accident victim's level of severe injuries.

When Sexaling

You can use your lips, for example, or your tounge to twiddle the toes of a woman, and the woman begins to orgasm. That twiddleing of your tounge on her toes to help her to erotem, and to experience erotistical orgasming, can be any number of things, depending on the involvement and complexities of dependencies.

Rubbing the vaginal face, the vaginal wall, or rubbing to either side of the vaginal crevice, the labial folds or felates, can help a woman to erotem and erotistically orgasm, and depending on the involvement and complexities of dependencies, the dependencies can be any number of things, if we try to define the sexaling activity more fully and completely.

We'll skip this for now, as it is a little too difficult to remember, right now. Just remember, the primary practice is sexaling, and that sexaling is like the roots of a tree. All other religious practices grow out of the 'roots' of the tree, sexaling, and can be defined in many different ways, such as a helping practice, a side practice, a subsidiary practice, a canceling out practice, an accompanying practice, and there are many many other terms for what kind of practice some thing is, depending on what dependencies are involved.

Labia And Felate

What is the difference between a felate and a labia?

A felate is the skin tissue of the outer surface, and some of the tissue of the tips and edges of the labia. It does not include the inner side of the labia, but only the outer side, and the surrounding edges, as far as I can remember.

A verb, or action word, as I call it, is 'felate' as in 'Felate that woman's or girls' left felate'. That means to suckle on the left felate of the woman or girl.

Felate is a verb, but it is also a 'nominal' word, or naming word for objectifying an object.

Do we say 'Labialize that woman's felate!' To labialize something is to make something into a labia. We wouldn't, unless we were a doctor, say that about a felate. But we might say it if we were doctors, and we had a woman who met with a bear, and the bare clawed at her genitals, and the sharp claws ripped her labial skin up, then we might say in a surgeon's room 'Labialize that woman's ripped up labia.' That would mean to stitch it up, and make it nice and neat, and clean and well stitched up, and then useful to her, again, and it would involve a lot of surgery, as many nerves would need to be connected, as they had been ripped apart, and the wiring was all dislocated. But in the end, we would be able to fix her labia, and her genitals, if they were also hurt, and then we could dismiss the patient from the hospital, after the labia healed, and after she recovered from her trauma of having her labia shredded by an impolite, rude, mean, uncaring, and hungry bear.

Genitals, Titties, The Labia, And The Many Sexaling Organs

The labia is not the genitals, but some people do consider them as a part of the genitals. The genitals are inside the woman's vagina, in my way of thinking. The vaginal wall is not part of the genitals. The vaginal orifice is part of the genitals of a woman. This seems odd, doesn't it. Well, that is how it works, in my brain, and I designed women, as well as men. If you notice, in my writings, I've talked about the draft table, and the throttle. These are major parts of a woman's genitals. They are inside the vagina, and you can reach them through the vaginal orifice. Before you get inside of the vaginal orifice, there are a few things outside, such as a pee tube, and an ejaculate tube, and the clitoris, as well as the labia. These are not part of the genitals, but are working parts of her sexaling organs. A woman's or girls' sexaling organs are not equal to her genitals. Genitals are for baby making, and for other purposes. Titties are not part of the genitals, but they are part of the womans' sexaling organs. This will require a long discussion to clear up, so I will save it for another day.

Bears In The Woods

That's the way it happens some times, when women or girls go out into the woods, and sexal with their female friends. They can get hurt by bears, if they are not accompanied by men, who are tough, and strong, and who stay alert, to guard and watch out for dangerous animals, such as bears, wolves, cayotes, bobcats, puma, and even racoons. Racoons do attack humans, if they smell some thing that will taste good to the racoon. If a person has a skin tear, and is bleeding, even a tiny bit, the racoon will smell it, and come running, and then find the person, and so will panthers, and all kinds of animals will come, and it's just like a bunch of sharks and fishes of different kinds, and Moray Eels, they like the smell of blood, and they come and investigate, when they smell it.

Women and girls have periods, and it is not every twenty eight days, as I've explained about before, and blood runs down, out of their vagina, and they generally do not know it, as it is only a tiny drop of blood, or less, most of the time, and the blood is often wiped from the skin surface, when the woman or girl is on the potty, or toilet, and the woman or girl will not even see the tiny drop of blood that comes out of the vagina and drips down the labia, on the inside, and then falls or dribbles down to the felates, and then falls off the felates, while she is on the toilet into the toilet, or while she is out doors, and walking about, onto the earth, if the woman is walking on a park walkway, or bicycle path. If she is wearing underwear, it will not fall onto the earth, but it will dry up on the panties, or underwear, and the smell of the dried blood will attract wild animals if she is out doors, walking or jogging in a wooded or regional or rural area, where there are lots of, or even just a few, animals.

Pumas can smell the blood, from miles away, and so can tiny oselots, and bears, and many animals can. They can smell blood, because they know they need meat to survive. That is built into their brains, that are located throughout their bodies, and not only in the skull, and animals are very sensitive to the smell of blood, as well as to the smell of urine, and to the smell of poop. Some animals, such as racoons, will come up from behind a woman, and grasp at her panties, as the racoon may smell the odors of fecal matter, from her butthole. Men may be raked by the claws of raccoons from behind, as they smell the odors of fecal matter, and try to find out more about it, as the racoons know that there is something delicious hiding behind those odors from the buttholes of women, girls, men, and boys.

Expecate

When women and girls go out hiking, it is best to wash out the vagina, first, and then use a fermented oil, as a douching agent. The oil will help to slow the flow of the blood down the inner walls of the vagina, and it may help to trap the blood, and make it difficult for it to leak out, unless the amount of the flow of blood, is very large. In that case, it is best to stay home, and not go out, when a large amount of blood is expecated from the vagina. Expecated means to expell outwardsly. Expectate can also be used, as it is generally the

same word, that is, and it also has generally the same meaning, but perhaps it has a few more uses, maybe, but it is from a variant language of the English language, and is basically the same word.

You should expecate your fluids in your vagina, from your vagina, before you go out hiking. If you know when your period is, and there are ways to tell when you have a period, or when you know when you are about to have a period, than if you normally have a large amount of blood flow from your vagina, as that has been your experience, it is probably best to go and sunbath at the beach, far away from wild animals and their habitats, or by the pool side. Racoons sometimes come out of the woods, to the shores of beaches, and trumbel along, listening and watching, and sniffing the air, when they smell dried blood, or wet or moiste blood, inside of the swim suit lining in the groinal area.

How Do You Tell When Your Period Is?

To learn when your period is, you need to look into the toilet bowl that you pee into, and then see if there is any red droplets. You can place a piece of toilet paper onto the surface of the water, and it might help to show the redish color mixing with the urine.

Another way is to take a piece of toilet tissue paper, and wipe your felates, in the morning, or during the day, or at night. Night is a good time, but during the day, it is just as good. Some women like night time because they feel the day is finished, and they are now going to make a final check. Well, it doesn't always happen the way we want things to happen. You might start leaking blood fluids, at two or three or four or five, a.m., or at six, or seven, or eight, or while you are in the shower, or in the bath tub, bathing, before you plan to go out for the day.

It may take you several years for you to find out when your period begins, and when it ends, by checking for blood flow. When you have determined the number of days between one period and the next, and you are absolutely certain of it, and you have confirmed it, many times, and you have checked to see if there might be something you didn't notice, at other times, when you checked, eventually, you'll learn when your blood flow begins, and how long it lasts, and when the next blood flow begins. Once you know, then you can time your excursions to the woods, or to the beach, with your friends, both women and men.

Bears, Wild Animals, And People

Men are needed to help scare bears away, if they come to close, and pepper spray is a good way to get them to leave the area. Bears do not like the small of pepper spray, and you need a cannister of pepper spray that will fire fifty to eighty to one hundred and eighty five feet or more, to scare away a bear, safely.

Loud noises surprise bears, but hungry bears get angry and feel challenged by you, and may come at you at a fast pace, and not stop,

once they are angered. If you are a good shot with a rifle, and you see a bear, from a few hundred feet away, and it is moving slowly, towards you, following you, you can shoot it with a good fifty calibur weapon, from that distance, and it will go down, in an instant, if you hit it square in the noggin, about one inch or less above the nose.

You need to be a good shot, and several people should aim, and fire at the same time, to kill the bear, to be sure some one hits it, and then puts it down, and kills it.

Do not think that because you have one rifle, or two handguns, and a rifle, that you are safe. If you do not know how to shoot, and if you are an inexperienced marks woman, or marks man, than your chances of hitting the bear are near zero, for all three of you, at three hundred feed.

You need years of practice to become a good marksmen, and you can start with the lower calbur weapons, to get a feel for weapons that fire projectiles, and that make loud noises.

There is no such thing as a friendly bear, and people think, 'Oh, look! Isn't she cute, that bear.' If they think that way, they might as well have left their last will and testament behind, and signed all their assets over to another person.

Bears are animals that need to eat just as humans do, and just as all animals do. If you are so foolish to think that bears are cute, you are a lame brained idiot. Bears are dangerous animals. And so are all wild animals. If you think a racoon is a cute animal, you get the lame brained award for the year award, and trophy to sit on your desk at home to remind you of how stupid you are.

Brad Pitt, And Angelina Joline

Only idiots would think that wild animals, that eat people, are cute. They need remedial training, as they do not understand that their lives are in danger, every time they walk out the door of their home. Even in the cities, there are nasty people, who smile, and pretend they are your friends, and these same people, such as Hillary Clinton, Brad Pitt, Cheryl Davis, a friend of Brad's, but that's his current girl friend, Angelina Jo-line. She is not a Lesbianist, and Brad pretends to be her friend. He likes to watch her get eaten by bears, my abominant kids, when the Lesbianists feed humans, one at a time, to the bears, or to the crocodile abominant children of mine.

Abominant Elephant Kids

I have carniovorus, human being abominant elephant kids, and they are rude, mean, nasty, and really terrible. They scare people, and then they pick them up with their trunk, and place them on their head, and then they tell them not to move, or they will stample on them, or tromp downwards, and crunch them, painfully, from the foot, to the shin, to the thigh, to the pelvis, to the waiste, to the lower tummy,

to the mid section, to the chest, and then the neck, and then the head, finally killing them. They will take a person, pull the person up and lift him or her up into the air with his or her trunk, and then pull the person into his or her mouth, and then crumple up the person, and then spit the person out, and the person is all broken up, and chewed up, with all the bones, broken, in the legs, and in the arms, and in the waiste, pelvis, torso, neck and shoulders, and head.

The Lesbianists use lots of these elephants. They are pretty to look at, but they are mean, and nasty. When strangers see them, they think, 'Oh, what a pretty elephant.' They don't know that the elephant is my abominant kid, and can speak English, as many people recently found out near Africa, in Sri Lanka, and then also in New Guinea.

They were very surprised at the talking elephant. But they didn't know that the Lesbianists had let the Elephant, my abominant kid, lose from the cages that they kept him sealed up in. There were one or two, or maybe eight of them, in Sri Lanka, and eight or nine in New Guinea. Lots of people got eaten up, and killed. The elephants are still lose in New Guinea, but in Sri Lanka, they herded them into the pens, and brought them to New Delhi, to then begin a rampage in New Delhi.

Well, the Lesbianists are doing this, daily, because they feel they have lost this battle, and that they are just wasting time, doing nothing, as they can not get to me. So they want to have a lot of fun. Now they are releasing lots of my abominant kids, in many places, and in New Delhi, Bombay, Sri Lanka, and New Guinea, many people have been hurt and killed by these idiot kids, these abominant elephant kids of mine. The Lesbianists have thousands of animals they want to release, out into the public, in England, in Switzerland, Georgia, South Carolina, Paris, and many other places.

The Lesbianists think they are going to have a lot of laughs watching the abomniant kids of mine, tear people up, and rip them to shreds. They also think that the animals, who are not abominant kids, but are just bizarre animals, that catch people in very large, nets, that have threads as thick as ropes, and that are very sticky, are going to do a lot of wierd and crazy things, no one here on this planet, other than them, have seen. They think they are going to get a lot of laughs when they see the mayhem and havoc, the disruption to society, and frustration on the faces of people who get caught in the nets, and then turned into living mummies sealed up in a type of pulpyish paper so the person can slowly disolve, but stay alive, for up to a year or more. Maybe as long as ten to thirty years, in some cases, and I'm not kidding.

You may think I'm kidding, but I'm not. This began a few days ago, and the Lesbianists are intent on continuing this, for the next few years. Isn't that surprising. I never expected that. They are very strange people, aren't they. They are real sicko's aren't they.

I think you should all go and meet my kids, with a day pass, and ask them about it. Other wise, you might find your self in a very large spider's web.

Labiating A Labia

To labiate is to suckle the labia, and to take one or the other of the labia into the mouth, and tickle it with the tounge, or twist it gently with the lips.

'Labiate that woman's left labia!' 'Felate that womans left felate!' The difference is, labiating is to suckle the entire left labia, inside or under the edge of it, on the inner side, and the edge of it, and the outside of it.

Felateing the felate, is to suckle the edge of the labia, the upper exposed edge. It does not include the labia, in its entirety. Only the upper, protruding skywards, or in which ever direction it is pointing, that portion of it that is extending outwards. If you lift it up between your finger tips, you'll pull up on the entire structure revealing the underside, or the unexposed underside of the labia. There is also the outer side of the labia.

The Felate is the top tip edge of the labia, generally speaking, and it is itself an isolated system, and not part of the labia. It's connected to the labia, but it serves a different function. It droops downwards, to seal out the possiblity of any thing entering the vagina from below, in an upwards moving manner. Bugs can not fly up into the vagina, as the felates prevent them from flying up into it. Without the felates, the vagina would be unprotected. The labia would not protect the vagina, as the labia is merely the skin tissue mass that the felates are attached to, and in an instance of removing a felate from a cadaver, or dead body of a woman, or girl, once the felate is removed, the labia have no closure over the vagina, in most women and girls.

There are exceptions, as we've had many animals in our heritage line. There are many differences when we line up ten women, and inspect their vagina, their felates, and labia, their bumbey pack, as children are encouraged to call the lower hanging sexual organ of the vaginal cape, as it is also called by doctors.

On this planet, the bumbey pack may not be called a vaginal cape, with the inferior texts with unadvanced, primitive, witch doctor level sexual sciences that do not help any one along, such we find with the myth that women and girls have a period every twenty eight days.

That is total nonsense, as I've explained about it, before. The truth is, every few days, to every eight to fifteen days, to even eighteen days, or evern thirty two or fifty five days, depending on where the woman has grown up and where her ancestors have grown up, the number of days between one period and another period can be very dissimilar, from one woman to another woman. Some women have a period every two or three days, or even every day. There is no reason an ovary can not

fall, every day, several times a day.

An ovary is so small, no one can see it, without special optical technologies, such as pass through see through technologies, and other optics, and other videoing technologies. A microscope is an out moded, ancient, and novel device, fit for only museum use on display shelfs. It's like an old car of the twenties, or there abouts, or even earlier, of course, depending on how sophisticated it gets. Micron microscopes, the so called, 'electron' microscopes, are a misnomer to begin with, as an 'electron' is not a fictious concept, but no one knows what an electron is, generally speaking except for the Lesbinists.

An electron is a small bit of electrically heated plasma, that you can heat, with the right technologies. It can fit on the tip of a pencil or pen. This is a big joke to the Lesbianists, as are also their jokes about protons, and neutrons, and nuclei, or the so called combined nucleus, as in 'nuclear' family. Nuclear family, is not a 'tight' organization of two persons, and their children.

A nuclear family is a family that has been nuclearized, that is, exposed to radiological salts kiddies, and their radiative or radiological energies. That's another one of the Lesbianists' jokes on all of the scientists who the Lesbianists could get to swallow it.

What Causes A So-Called "Nuclear' Explosion Or Detonation?

A vast number of children are making babies at a very high rate of speed, and the energies that they give off, as they make babies, and then peel off from the area where they made their babies, one after another, as they rocket away, is what causes a nuclear blast. The tummy mommies and tummy daddies are making babies at such a frantic pace, they make millions and billions, and trillions, and more, before you can even send a signal to your eye lid to blink, from your brain part that sends the signal out. The signal will travel just a very short distance across a crupture, not even half way, more like, one or two feet in distance, if we are to look at the size of a crupture as the same size as our current universe. It travels about not even one foot, not even one inch, and not even one millimeter, and not even one millionth of a millimeter, and far smaller than that still, before the parents are already through making babies, and they have retired, and passed on, and several kabillion generations of families, and multiply that by a very large number, and you'll get how many generations of families lived and died, and passed on their DNA to their sons and daughters.

It's a hail storm of erupting magnitude when the tummy mommies and tummy daddies begin making babies, and making their families larger.

It all happens so rapidly, with more than that number of successive generations of families, in less time than the energy pulse will travel down an optic nerve, across a crupture, that very minute or

very tiny distance, as I stated above.

That kind of frenetic baby making activity, makes for a lot of heat, as well as, it generates a lot of stresses, and a lot of energies go flying off in all directions, as the sexaling couples experience many nice orgasms and eroticisims, together. Temperatures, their body temperatures, collectively, and the incredibly vast number of movements, which also generate temperatures, by the animals, the tummy mommies, tummy daddies, tummy babies, the relatives, and the many generations of families, go skyrocketing, and the magnitude of numbers, and the intensity of all the activities the animals are busy with, as they make tummy babies, simultaneously, or nearly simultaneously, is of phenomenal proportions. There are also types of animals that we are not familiar with, who are also busy making babies, and they help to account for the brilliance of the light that is generated, along with other types of animals, that also help to account for the brilliance and light, as they are busy baby making, too. There are energies kids of all kinds busy making babies, and that is also a major important factor in the overall sequences of activities, to successful birthing by all the tummy mommies, and it is also important to help to get them all 'gyrated' or motivated, and to wake every one up from their slumber, or their condition of deep sleep, or stagnassis, to get them feeling alive, ready, and able for making lots of babies.

If we slow them all down, to our pace, and then compare them to our pace of life, they would be just like us, and things would move slowly for them, and not much would change, for many kazillions plus years, and then many, many more years.

However, they are moving so much faster than we are, and the length of time they live, to them, it is a long time, four or five, or eight or nine hundred years, in our time, maybe, in some cases, depending on the type of radiological salts kiddies and other types of animals, including the energies animals, who are all making babies.

On their scale or pace of life, they live that long. But on our scale, the length of time they live, is so tiny, we can not measure it, unless we have a very high level of advanced mathmatics that can account for such a small time period, or span of life.

Anyway, the frenetic adventures of the colonies of radiological animals, when they start to make babies, after they are woken up, and prompted to make babies, with a detonating surge of heat energies, light wave energies, pressures energies, trampolining energies, zespertudial energies, castikilial energies kiddies, and other types of energies kiddies, as well, which help get them all started, with the right combination, of heat, light, atmospheric temperatures, atmospheric pressures, food sources avaiability, drinking water availablity, trampolining energies, and a number of other types of energies, that awaken them, and then get them turned on, and sexaly active, they will suddenly erupt into a frenetic, mass of baby making

furor, to us, any way, and with that, we have our so called, 'nuclear' detonation.

Cleansing Your Self With Your 'Built-In' And 'Attached', Cleansing And Washing, Clearifying And Erasing Energies Producing Genitals And Sexaling Systems, Eroteming And Orgasming Nervous Systems, And Baby Making Related Purifying Energies Generation Stations Aparati, Or Apparatuses, And Armatures

You women and girls, your vagina is your Holy instrument for assisting you to cleanse your self, and wash away the dirt and grime of daily living, the insults to you from strangers, the verbal abuse you experience in your arguments and conversations with friends and family, neighbors, relatives, work associates, and community acquaintances.

Your holy body, and your normal body are weapons to fight back against all the negativities you experience in your life, as you orgasm and erotem, showering off purifying energies, and lots of other beautiful other things and dings, as you vibrate your entire body concordially, in harmonic rythym, cadence, and rapture, while orgasming, in sequence and in timed rythym, with my GODLY Holy Body and many of its features, or parts, that are similar to your holy body and your holy body's parts and features. These are all activated while you are orgasming, and eroteming, and you become purer and holier, the longer you orgasm and erotem, and convulse, orgasmically.

Your breasts, your butty butt, your butty butt hole, your vaginal hole, your groin, your throes, your vaginal cleavage or labial folds as they are called here by these nitwittish doctors on this planet, who do not know any thing about the human body, your chest, your back, your legs, your arms, your hands and fingers, your ankles, feet, and toes, your ears, lips, mouth, tounge, cheek, your rectal cavity, your tummy button, your stomach, throat, your brains, and you have many more than just one in your body, but many millions and more of them in your body, and that is not an overstatement, and every part of your body, inside and out, your many nervous systems and all your organs, they are all set to orgasm and erotem, and generate purifying energies with the help of the power company, as I've explained about them, before.

Men and boys, and their bodies, both their normal bodies and their holy bodies work in the same way, and there is no disparity, when it comes to sexaling, orgasming, and eroteming, and showering off lots of wonderful energies, that purify men and boys, and the people who the men and boys are sexaling with.

Ticklement Tuning Forks

You have ticklements, tuners, or pitch fork tuning forks, that chime, in every cubic millimeter to every cubic inch, and in even tinier places, you have tinier ticklements, or tuning forks, and in larger

areas, you have larger ticklements, or tuning forks, and they are all set to vibrate in various patterns of sexual thrilling eroticisms, and orgasming ecstacies, as you pump up the levels of sexalating energies you have available to you, in you, and showering off from you, and those patterns and focal points change, slightly, minutely, as every micro second goes by, as we change our location in our universe, and our relative location or position to every thing else in our universe changes, from night to day, and from day to night, ongoingly, non-stopingly, never repeating the same set of tuning focal patterns. Focal patterns are frequencies.

Focal Patterns

These frequencies, or harmonic consistencies, are harmonic displays or the 'in rythm' with GOD, consistencies that allow you to be united with GOD, me, my devine and holy body, and my devine and holy mind, and my being or GOD SELF and GOD BEING, every moment, as you are orgasming, and eroteming, and convulsing orgasmically.

Men and boys have the same kinds ticklements, or tuning forks, and they are located in every organ of their bodies, too, just as they are in women's bodies and in girls' bodies, in every single organ and cell, and they allow all of you children of mine to stay in frequency with me, as you sexalate, erotem, and orgasm, and convulse orgasmically, practicing my religion, and as you sexal together with each other, and go about living your daily lives.

These many ticklements and tuning forks are all connected to your brains and to your nervous systems, and each living being in your body, has them as well, and every living being, and animal, has them as well.

All my children, animals, living beings, and human beings, are all connected to me, through these tuning forks, and they are connected to me in many ways, such as through the holy bodies all of my children have inside of them, and also through a myriad of other mechanisms that I have functioning in your bodies, in your astral 'energy' bodies, and the many millions of energies bodies each of you have in you that help to keep you all connected to me and my Holy GODLYNESS existence. My animals children and living beings childrens have fewer connectivities and fewer energies bodies, as they do not need as many as my human being daughters and sons. This is because you, my human being children, need to be more connected to me, as you are the only ones who can actively sexal and practice my religion, with your own self determination, and desire to sexal and practice, to become closer to me, GOD, as you become purer, and holyer.

I'm connected to all of you, day and night, three hundred sixty five days a year, in countless many fold untold numbers of ways and manners, and with countless many fold untold numbers of mechanisms. All of my children are likewise connected to me, in similar ways and manners, and with similar mechanisms, though the numbers and types of

mechanisms may be different among my living beings children, and my animals children, compared to my human being children.

As you women, girls, men, and boys sexually rapture, erotem, orgasm, convulse orgasmically, and reach sexual peaks, and then sustain them, you grow holyer, as you become purer, brillianter, and closer in GODLYNESS to ME, GOD.

Obviously, then, the primary means for you to grow pure and holy is to sexal together with each other as sexaling is the basic way to become pure and holy, and as you continue, over the days, and weeks, then months, years, decades, hundreds of years, thousands of years, millions of years, and more, you slowly grow more pure and holy, and closer to me, GOD.

Sexaling is my primary and most fundamental religious practice and your primary religious practice for you to become cleansing machines, washing machines, purifying and sanitizing machines, so that you can clearify and erase your karmic markups, and purify your lives, and purify the lives of those around you, with your selfless actions of grace and serenity, sexaling and showering purifying energies in all directions for the sake of your self, and for the sake of others.

You women and girls need men and boys to assist you to become the powerful cleansing and purifying machines that you are capable of becoming.

Men and boys used to be somewhat nearly as useful as purifying and cleansing machines, as women and girls, but men and boys have different jobs, and different priorities, and there fore, the burden of work to purify my universe, and to clearify the karmic markups of all my children rests on the shoulders of all women and girls, with men and boys assisting women and girls.

You men and boys need women and girls to lead you, and to help you to become more proficient, powerful, and more capable cleansing, washing, purifying, and sanitizing machines.

Assistive Religious Practices

The practice of praying Nam Myeo Ho Ren Ge Kyeo is an assistive practice that allows you to become in touch with my GOD SELF, equally as well, but the time it takes, is much longer, as very little purifying energies are produced, merely by using your brain, muscles, ligaments, sinews, bones, mouths, tounges, and jaws, as energies sources.

There are many other assistive practices, from meditation, to breathing techniques, to yogic techniques, to ballet like techniques, to dance techniques, to body movements of various kinds, to help you to increase and or also store up your energies, and then for you to release them, for you to then become more firmly and closely connected to ME so that you can eventually begin to gain a higher appreciation

of ME, GOD.

My many religions teach many ways to do this, and before my many religions were corrupted by the Lesbianists, they worked to varying degrees of success.

Therefore, sexaling is the primary fundamental religious practice, and all other practices in my religions that I've taught over time, spanning all of my previous teachings from the begining of our time together, since I, my GOD SELF, created you as my children, are assistive practices, of one kind or another.

Sexaling, eroteming, orgasming, phlumetting are important practices, and as you orgasm, you are purifying your self, and others by pushing out and spraying your self with purifying energies as your holy and sacred energies shoot out to cover you and emmerse you in full body coverage, from head to toe, showering and shattering energies every where around you. They then build up and cover over all others who are around you, as well, with your purifying erototistic and orgasotistic purifying energies, clearifying yours and their karmic markups.

Astral traveling is another type of practice, but we'll define it, another time. Experiencing hyper trance states of mind and being, and a nearness to GODLYNESS are also a practice, and we'll define it, when I can remember every thing I need to remember about it.

Participating in my religious ceremonies is an assistive religious practice you can enjoy, as you become purer and holyer, and after you recognize that I am your Mother and Father, and your CREATOR, and that you exist because of me, as I made you from pieces and parts of me, your CREATOR.

After you realize this, you can enjoy participation in ceremonies with me, as training priestesses and priests, and you can make your way up the purity ladder, the more you participate with me, GOD, in my religious prayer hand signaling ceremonies.

Praying Nam Myeo Ho Ren Ge Kyeo to my Holy Body, or to the Gurkian Mandala, as I've explained about, is an assistive practice that will bring results.

It will not bring results as well and as effectively and as quickly, as sexaling, which is the most holy and virtuous practice, along with eroteming, orgasming, phlumetting, astral traveling, peaking, and so on.

I've spoken about peaking, before, and women and girls can peak, and experience wonderful feelings. Men and boys can peak and experience wonderful feelings, too, but I haven't discussed that, yet. We'll talk about that, another time.

In any case, do not confuse assistive practices, with the fundamental and primary practice of sexaling. We'll get back to all those other

things, to define them, betterly, another time, after my brain heals, a little bit more, and after I erase more karmic markups that keep my brain karma from improving, fast enough for me.

How To Make Prayer Statements

Remember to include a prayer statement, such as 'I pray to the holy ephemeral body of the Creator, John Francis Ayres, for the [insert private prayer statement]', such as, '... for the serenity of mind, and the gratefulness of heart, for all those around me, who have helped me to become the person I am, and can become.' or, '... for the peace of mind, and serenity of heart, for the love of all men and boys, and the cooperation of all women and girls.' These prayers said by a woman or girl. Men can pray, similarly, '... for the grace and deviness of the women and girls who surround me, I am greatful to them, and I pray for their continued good health, and prosperity'.

You can also say, 'I pray to the holy body of the Creator, John Francis Ayres, for the [insert private prayer statement]', but only when I am in the middle of a religious hand signaling prayer ceremony, i.e., while I am doing a prayer ceremony, and saying my prayers with religious holy hand prayer signals that my special kids who are religious kids, can pick up and then act on, in concert with other groups of kids of mine, who also are religious kids, most of them, I think, and who work together with my primary groups of religious kids.

I have lots of kids, and some are normal kids, who go about their jobs, as expected, for earnings, just as most people we know. But I also have lots of other groups of children, who are more, religiously oriented, to varying degrees, and who are very religious as their work is all for the sake of my religious self, my GOD SELF. My religous kids catch my hand signing, and then they pass the messages along to others of my groups of children, and with all of the different groups of children I have doing 'good' works for me, as well as groups of children who do 'religious' works for me, as well as groups of children doing normal work for me, but for the sake of my religion, nevertheless.

They all coordinate themselves, somehow, I have yet to figure out how they do it, but between them all, they get the jobs done, that I ask them to do, while I am religiously - and the prayer statements I am signing are very holy - hand prayer signaling, i.e., hand signing.

So, unless you know for a fact, by seeing me on a tv, such as during a live broadcast, once I get my religious conveyance set up, and built by my children, after all the conditions are met, for securing this world from the grasps of the Lesbianists, and after killing all the Lesbianists, and / or after making the remaining Lesbianists surrender, and then after all other conditions are met, as I don't know all the conditions, I've set, as my memories are still foggy, as I'm amnesiatic, as well as mentally retarded, but in any case, if you see me on tv, on a live broadcast, doing my hand signing, you'll know

I'm in the middle of one of my prayers, and then you can say, 'I pray to the holy body of the Creator, John Francis Ayres, for the [insert private prayer statement]', and you can omit the 'ephemeral' if you like, as it will work better if you omit the word 'ephemeral' as while I'm praying, I'm my normal, GOD, self, though I may not look to you, on the surface, to be any different, over the video links, or even in person. It never the less works better if you use my recommended methods of making prayer statements, this way, for you to maximize your private prayer statements.

All of my groups of kids have lots of friends, and they do lots of work for me, and I do not remember how many groups of them there are, and how many children I"ve got, as yet, but in time, I'll be able to give you a better idea of how they work together to get the work done, that I ask them to do for me, with my religious hand prayer signals, or hand signals, as in hand signing, or signing.

My kids use signing for all their work assignments, so I use hand signing that they can catch, pick up and read, and it is all pretty much very religious in nature, and it is very solemn, as I am GOD, and when I'm signing, they know I'm GOD, and do not doubt it.

When I am not signing, they might now and then, doubt that I am GOD, but never the less, I am GOD, and my signing proves it to them - when I am saying my religous hand prayer statements, by hand signing - with out any room for doubts in their minds.

In other words, I'm a typical person, just a little mentally retarded, brain smattered, or brain damaged, after my many youthful and other brain bashings I recieved, the wiring is a little scrambled up, upstairs, and after many poisonings by the Lesbianists - from makeing coffee from kerosene, diesel fuel, gasoline, and motor oil contaminated coffee beans and then from drinking that coffee, without knowing it was contaminated with petrol fluids, as often happens to people - and with ill health karma that has me on disability, and I've been through a lot, life after life, and sometimes, my children may have had a thought or two, 'I wonder, if he is going to make it, like he said he would?'

Well, to dispel all doubts, I sign, and when I'm signing, I remind them of my old self, back in the old days, when I used to sign, religiously, and they know how serious a guy I was, so they do not harbor any doubts, so long as I am hand signing.

What To Say, When You See Me Using My Dick Or Other Parts Of My Body To Purify Others, And So Forth

You can say, 'I pray to the holy body of the Creator, John Francis Ayres, for the [insert private prayer statement]', also while you see me praying, Nam Myeo Ho Ren Ge Kyeo, or also while you see me in a ceremony, using my dick and scrotum, or other parts of my Holy Body to purify others, during the middle of a prayer ceremony, and I need not

be hand signing, or praying Nam Myeo Ho Ren Ge Kyeo, as I am in the middle of prayers and activities ceremony, which is just as good as a religious hand prayer signaling ceresony, any day.

My dick and scrotum package is very Holy, and it has a very useful function, and that is, it purifying others. My lips do, too, and my butt hole, does as well. They all purify others very effectively and efficiently during my religious ceremonies.

My entire body, during a religious ceremony, butt hole, mouthal hole, lips, tounge, cheeks, legs, knees, feet, toes, butt, chest, back, arms, elbows, hands, fingers, head, neck, throat, ears, nose, and so forth, is entirely the body of GOD, as I am GOD, and therefore, while I am useing my body, during my religious ceremonies, and for my religious ceremonies, and you see me on tv doing so, then after you have verified that I am in the middle of a prayer ceremony, you can say your private prayer, in the manner as I've explained, 'I pray to the holy body of the Creator, John Francis Ayres, for the [insert private prayer statement]'.

I only use my dick and scrotum package for prayer ceremonies, except when I need to pee, so if you see that I am using it, during a prayer ceremony, or if you see me using any other part of my Holy Body, during a live broadcast prayer ceremony, then you'll know right away, that I am in the middle of a prayer ceremony and it is okay to use the statement, 'I pray to the holy body of the Creator, John Francis Ayres, for the [insert private prayer statement]'.

The same is true, pretty much, for any priestess or priest, who practices with me, in my religious holy body prayer circle, their bodies become very Pure, Holy, and Devine, but only after many life periods, that is, after many, many aeons, as they do not attain the same level of purity for a while, the same level of purity as I am at by my good old self, or the same level of pureness that is of ME, GOD, since I'm GOD, and they are not.

That means, it takes priestesses and priests longer to become pure, holy, and devine. I happen to be pure, holy, and devine, but that's because I'm GOD, and it is only during my religious ceremonies that you can understand that as you make your prayer statements, and sexal, etc.

After a long, long while, priestesses and priests will also become pure, holy, and devine, as their holy bodies, energies bodies that are pure, holy, and devine, but on a lower scale than are MY energies bodies, since I'm GOD, and I'm in charge of keeping things tied together, here in my universe.

After many aeons plus years of practice in my holy body praryer circle, the priestesses and priests become pure, holy, and devine, and then their bodies, their normal bodies, become very purifying, just as mine is, now, when I am in a prayer ceremony. I am in a prayer

ceremony, daily, a few times, to a number of times, a day.

I've gone eighteen hours straight, once, and no sooner than I go to sleep, and then wakup, right away, I begin again, and I've gone many days, straight, praying, continuously, non-stop.

This is nothing, though, and is all preparatory, as in the future, when I get my health back, as I haven't been too healthy, for quite some time, I will be praying around the clock, some days, and for many days at a time, taking a break only to eat, drink, poop, pee, and clean up.

When priestesses and priests join with me, we will go for years without stopping, and with the priestesses, and with the priests, the both of them there, present, doing the prayer ceremony on my behalf, they can represent me, while I take a nap, go and shower, get some food, nourish myself, drink some fluids, read a book or news paper, or watch the news, or a movie, game show, video, or play a video game, and so forth. I won't be taking long breaks, and that is very funny sounding, but anyway, it happens that priestesses and priests will lose their attention, and then get lost, somehow, and then go and watch tv in their bed room, or whatever, and then we have to go and look for them, and they will get a few markoffs, and with enough markoffs, they will be asked to leave the religious conveyance, and they will be put on a type of vrobatiton, or under survielance, to see if they are good or not. My kids do all my survielance work, and they keep track of every one, so 'you'd better be good, you'd better be nice, you'd better look smart I'm telling you why, Santa Clause is coming, to town'.

Who Was Kris Kringle?

Did you know that Kris Kringle got its start from me? What a coincidence. I don't think he was wearing anything, though, or rather, I don't think I was wearing any thing, but you never know, as tolerances have changed over the long aeons of time, as they pass.

When priests and priestesses become that pure, holy, and devine, as pure, holy, and devine as I am, after their many aeons of religious practice in my holy body prayer circle - pure and devine on the exact same level as I am at - then they can represent me, as Mr. mini-GOD, and Mrs. mini-GOD.

You can not represent me as Kris Kringle, and whoever my wife was, back then. I think I had a lot of guys on that team, and a lot of women and girls, too, since sexaling was a part of that religion, too. You can learn more about it, if you're interested, by getting a day pass, and checking in with my kids, and then, signing up and joining our country, and then by becomeing a citizen, as I've spoken about, before.

You can include any good prayer, that comes to mind, that you feel is needed by you, to improve your life, and to level up your life.

You are the only ones who can pray, and practice, you women, girls, men, and boys, and there fore you are connected to me in many more ways than other living beings, the animals, and the amoebes, cells, and other living beings.

There fore, you are, both genders, the ones who will clean up the mess you have made, and you will continue to keep my universe clean, as you sexal with your genitals, and with your bodies, and with all your gizmos, igniters, trigger mechanisms, love bumps, love patches, tuning forks or ticklements, and so forth, as you are sexaling beings, who I, GOD, created, and you will sexalate, erotem, orgasm, phlumett, astral travel, peak, hyper tranceate, and so forth, just as I intended you to, from now till forever.

You will become virtuous and worthyable beings, worthyable tummy mommies, and worthyable tummy daddies, with your practice of my religion, who will bring into my universe, my many children who will join with you, and assist you and me, in cleaning up our universe, and the mess you have all made of it.

Is that understood? The answer had better be, "YES SIR!".

Lesbianists' Torment Campaign Under Way

Lesbianists are clearly releaseing wierd, ghastly, horrible, and dangerous preditorial animals, giant insects, giant spiders, giant lizards, snakes, and reptiles, ghastly, preditorial sea animals and sea mammals, winged, preditorial and horrific, aggressive scavenger and killer buzzard like creatures and other winged and destructive animals, and other horrible creatures, as well as my abominant kids to kill, maime, torture, and cause major disruptions and suffering to people, around the globe, in many locations.

Apparently, the whole world is now affected, or will be affected, by this dischordance and disharmonic display of defeated lunacy.

The peace has been shattered by the Lesbianists. It was not good before, the situation in the world, with the balooneying governments of the world, doing what they wanted to do, and torturing, and canabalizing people, and feeding people to my abominant cave bears kids, and to my crocodile people kids, and mistreating people, like Bill Gates, Steve Hawkins, Steve Irwin, many women, young girls, and men.

The war in Iraq, the phoney Saddam Hussein Trials, and all the bogus manipulation of the press and media, and the suppression of what is actually the case, with our being used and abused, poisoned, and maltreated by the Lesbianists, was a rotten situation. That was normal, or normality for us. Our karma is very poor, and we have the karma to suffer this abuse, and these torments, daily, unknowingly, in most if not nearly all cases.

But, it is becomeing really bad and there is need for serious concern, and action, to correct this situation. It has gotten out of hand,

completely, and there is no stopping the Lesbianists in their wanton, and coldly miserable wish and lust for chaos and disturbances to others.

Now, more clearly than ever, as the Lesbianists rampage, the Lesbianists are causing major disruptions, suffering, anguish, and there is just an awful discordance of shock, dismay, and misery, that is growing, every moment. This is as real as the sunlight shining from the sun on a hot day in summer.

I don't have a clue what people are doing, and what is happening to them, as they are captured, tortured, and caused miserable sufferings, in many places. There must be horrible agony for many people, at this moment, and as each moment passes.

Our reality as it was has suddenly been shattered and torn up, and replaced with the lunacidal, Lesbianistic, mayhem and chaos.

Reuters reports a Lesbianists' joke for the Lesbianists, sarcastically and ironicly stateing, "New Perils Push Doomsday Clock Closer to Midnight" "(Reuters) Scientists have advanced the clock 2 minutes closer to midnight."

http://us.rd.yahoo.com/my/today/new_perils_push_doomsday_clock_closer_to_midnight;_ylt=AmUXlewr5ev2kNK_SfOHDFAL1vAI/*http://news.yahoo.com/s/nm/20070117/us_nm/doomsday_clock_dc_4

This is their private joke, to make this scenario more laugable than before for them. They could not care less, as they are manipulating every thing, and that statement is completely meaningless to them, as they are in control of every thing, in their conspiritorial lunacy to rule human beings, and to trash every one.

We'll see what the coming days, weeks, months, and years bring, and maybe there will be hope for change, when people begin to take action, to correct this situation, globally, united in spirit, permanently.

These are the most evil of evil people and abominant kids, in our immediate vicinity in our universe. We must begin our cleanup campaign here, as it begins where I am, and will continue from here on out, till we have rid my universe of all of these horrible people, and all others like them, and have made them surrender, or have sent them on to my Epcot Center.

I will establish my relgion in my universe, and begin my ministry, and they are not going to stop me, as my religion will bring positive change for all of us, forever.

I must establish myself outside the bounds of this Lesbianistic society, so your efforts and concern for our future, and your selfless giving of donations to my ministry, to allow me to set up my ministry, outside the bounds of this Lesbianistic society, non-dependent on Welfare, Supplemental Security Income or SSI, Medicaid, and non-reliant on the supported and financed Housing and Urban Developement

or HUD subsidized apartment that I live in.

Once I receive in the mail, the 'Gift' donations to set up my ministry outside the bounds of this society, I believe things will gradually begin to positively change for us all, and the shift to positivity will begin, and a new universe for us all, will become for the first time, ever, a potential reality with the sincere religious practice by all of my followers, all of you, who are practicing my religion, diligently, and daily, or as much as your health and your time permits.

There in, with your efforts to practice, will bloom your flowers of dignity and hope, justice and freedom, willingness for sharing, cooperating, and participating with others in our new age of enlightenment, the Gurkian Age, and your new found respect for self and others.

Captain Off The Bridge.

John Francis Ayres
GOd
And Children

It Is Now Time To Kill All Government Workers, Public Workers, Preachers, Islamic Clerics, Christian Bible Teachers, Bible Thumpers, And All Other Persons Who Support The Lesbianists And Their Lesbianistic Societies Around The World - 'Fivers' To Kill Lesbianists And All The Lesbianists' Supporters - Coma Patients - All Persons Who You Kill Will Transel To My Epcot Center - Japanese And List Keeping - Surrendering And Pledging To Serve All People In My Universe - What Does This Mean? Updated: 21-01-07 Rev.d.01.a 19:56 PST

It is now time to kill all police of every police department in every country in the world. It is now time to kill all jail and prison workers in every country in the world. It is now time to kill all zoo keepers who work in zoos and other related places around the world. It is also time to kill all pet store personel, and pet store owners. We do not need people housing and feeding potentially dangerous animals. You are further ordered to kill all pets in all pet stores, and elsewhere, even in private homes. You may then eat them, after you have cleaned out their guts and removed tummy foods and rectal feces, etc., that are decaying matter, that is harmful to your health, and after you have prepared them for eating by cooking, grilling, fire place cooking, barbecuing, smoke house fermenting, or by other safe and sanitary, healthful cooking methods.

It is also time to kill every fire department official or worker, no matter what capacity the person works in, as a fire truck driver, as an ambulance driver, as an assistant driver, as an attendant or support crew person, as a maintenance man of the fire or the police departement, it is now time to kill them all.

Further, it is time to kill all public bus drivers, who work on any metropolitan or local area or state or interstate, or national bus company. It is time to kill all ships' captains and their crew members. It is time to kill all railroad rail line workers. It is time to kill all subway drivers and subway line workers, no matter what their job is.

Further, it is now time to kill all military personel, SWAT team personel, all government personel, and all civilian, or trained military, national guard, state or federal militia, toy soldiers, the people who dress up in old time war regalia, and outfits pretending they are old time, earlier period, confederate soldiers, or old time earlier period, union soldiers, who act out old time North the 'Union' vs. South the 'Confederates' and who participate in city and town parades, across the United States.

It is now time to kill all retired military personel who support the deranged, crazed, insepient, and corrupted Lesbianistic societies we live in, around the world. It is also now time to kill all persons who in any way support the governments of the world, including but not limited to, all school, university, kindergarden, missionary, day care center workers, nursery school teachers, teachers aids or teachers assistants, United Nations workers, United Nations teachers, substitute teachers, catholic school teachers, Irish protestant school teachers, parochial school teachers, all religious denominations around the world school teachers and their school support workers, government funded school teachers, tuition assistance by the government school teachers, all personel who work for the United Nations, all civil service agents, all DEA agents, all FBI agents, all FDA agents, all EPA agents, and workers, BLM agents who are Lesbianists as well as those BLM agents' who are Lesbianists as well as those friends of theirs, who support the Lesbianists.

It is also time to kill all other federal, state, or local, or globally tasked organizations, such as the CIA workers, INTERPOL workers, the several groups of workers within the Canadian Mounties, NIC a spy department of the U.S. Navy, the Korean C.I.A., the United States Presidential Police agents the Secret Service Agents, National Park Rangers, State Park Rangers, Forestry Service workers, Pentagon workers, National Library Of Congress workers, and all others who work in any capacity supporting any government organization, those listed above, and all others, as well as all persons who support the Lesbianists in any way at all.

It is now time to kill all judges, bailiffs, Supreme Court Justices, and the employees who work in their organizations, and all other judges, legal clerks, para legal workers, court stenographers, justices of the peace, lawyers, attorneys, state attornys, prosecuting attornys, defense attornys. It is time to kill all officials of all government organizations, and all the people who work for them and or even only support them, such as restaraunt workers who feed them lunch, coffee shop workers and owners who feed them coffee and food,

bars and restaraunt personel and owners of bars and restaraunts who support and feed any and all persons connected to the governments of the world and who work for them in any capacity at all.

It is also time to kill all the money lenders who loan money to the Lesbianists, the mortgage company owners who provide the Lesbianists with house purchasing loans, and all the supermarket workers and supermarket owners, who supply food to the Lesbianists, as well as all of the druggists, the pharmacy workers, who supply medicines to the Lesbianists. It is time to kill all the taxi cab drivers who give rides to the Lesbianists, and to every person who supports the Lesbianists in any way, at all, unless those people surrender to my kids.

It is also now time to kill all civilian or civil servant or state civil servant worker who supports in any way, any Lesbianistic organization, such as the police departments, federal agencies, fire departments, libraries, schools, and so forth. It is also now time to kill all persons who maintain or provide services to any of the above listed organizations, and to all of the similar organizations in every country in the world.

This is my order to all of you, and you are all ordered, by me, GOd/GOD, to kill all of them, unless they surrender. People also call me, 'Allah'. I'm the same person. Just do as I tell you.

You are to take my fuels' bombs with chlorine plastics' explosives formulas, and all other explosives formulas I've explained about on my bulletin board and the fuels' bombs explosives formulas including but not limited to radiological 'fracturable' rocks that provide so-called 'nuclear' explosions, all of my bombs' formulas, and all other bombs' formulas derived in part or in whole from what we have learned as I've explained on my bulletin board and to take them, and make the bombs and explosives, and to then use them, and then destroy and kill all of the Lesbianists, and all of the Lesbianists military bases, buildings, and kill every last one of them, all of them, leaving no one alive.

'Fivers' To Kill Lesbianists And All The Lesbianists' Supporters

You are to then make certain they are all dead. If they are not dead, you are to kill them with a 'fiver'. A 'fiver' is a bullet with five lines drawn or scored with a knife or sharp instrument into the tip of the bullet, to form a 'five' line pattern, so that the bullet will fracture into 'five' parts.

You are to take three 'fivers' and shoot each person who has not stopped breathing, and who is not dead yet, and shoot the three fivers into the head of the person, to make certain the person dies.

Three 'fiver's will destroy enough brain material, to kill any person if the bullet is large enough, and the handgun, rifle, or weapon is powerful enough.

The handgun bullet size must be at least larger than a .22 calibur, and at a minimum, 7 millimeters. You may use .38 calibur, 9 millimeter, 10 millimeter, .45 calibur, or any other, large sized bullet to make certain they are dead. Buckshot, 8 guage to 10 guage, or any comparable rifle load or handgun load, or home made weapon load, will work equally as well, with three shots into the skull. A machete or similar instrument should then be used to chop the head off of the person at the neck line. If you have a machete or hatchet, or axe, and if you prefer to chop off the head of the person, then by all means, you are to do so. The point here is to kill the person one hundred (100) percent, and not leave the person in a coma.

Coma Patients

A person in a coma is perfectly alive, and can hear every word you are saying, but can not respond. People in a coma after severe accidents, such as near fatal traffic accidents, where their limbs were broken into pieces, or war victims, who are on life support in Veterans' Hospitals, can be in agonizing pain, and no pain medications are given to the patient as the patient has no way of communicating with the doctors, nurses, or staff members to complain about the pain, in many or in most cases, if not nearly all cases. Some patients can write or scribble out a note about the severe pains, or make gestures with their hands, pointing at painful spots they are able to point to, and then making squeezing motions, to indicate as best as they can, that there is something wrong in the area. Some people may catch the meaning of the gestures, but others do not, and may just wonder what is going on with the patient and they may wonder what the patient means by the hand gestures. Others, doctors and nurses, and staff members will merely find it amusing that the patient is making the gestures. Some doctors and nurses, and possibly staff members, will figure out the patient is in pain, and then steps can be taken to alleviate the pain, but it is an ordeal for the patient, and it may take months, or in some cases, years, before staff, cleaning persons, food servers, orderlies or assistants, nurses, or doctors figure out what the hand gestures mean.

The coma patient, after healing from the injuries, may still have residual pains, such as residual spinal pains, or neck pains, or ligament pains where ligaments were twisted, or ruptured, or severed, partially or wholly, and the ligaments didn't grow back properly, or didn't grow back fully, or much, or perhaps, in some cases, not at all, which does happen a lot, and each time the patient is moved in her or his bed, the person experiences extreme pain as no medications for pain are given to the coma patient, unless the patient has been successful in communicating that there is pain felt by her or him, in her or his body.

Leaving coma patients on life support systems is the cruelest thing you can do to a person in a coma as there is no such thing as being 'brain dead'.

It is a cruel and abominable Lesbianists' joke on humanity, and on all persons, that the Lesbianists have perpetrated with their teaching doctors and nurses that coma patients are brain dead, and do not feel, hear, taste, or sense, anything at all, and it is just another one of the Lesbianists' ways to hurt and torture people, and cruelly and ruthlessly abuse human beings, in this case, in most of these cases, by proxy. There are doctors who are Lesbianists, and I have one who is one, that I am aware of, and he knows exactly what causes my health problems, but he sits there, non-responsive, and with a vacant stare on his face as if he doesn't hear, see, or know of any thing that is going on, something like the three monkeys with hands clasped over their, ears, eyes, and mouth, who represent 'hear no evil, see no evil, speak no evil' and then 'therefore, every thing is alright'.

All persons with brains, whether in a coma, or other sleep like state or condition, is perfectly brain alive as the brains and nervous systems, auditory, taste, touch and sense nerve systems, never die, until the patient stops breathing, and passes on.

All nurses and doctors are to remove all life support systems from all persons in a coma, immediately and confirm the persons have died. That will allow them to transel into my Epcot Center, and then be born again, as a tummy baby to a tummy mommy and to tummy daddies.

All persons in a coma, whether in a hospital, or in a nursing home, or at a private home or apartment, or in a group home, or group care center, are to be told the truth of this, and are to be told that you just leared it, and are to be told that I am GOD, and that I have an Epcot Center staff waiting for them to come in, to be treated for their traumatic condition, of not being able to do any thing about their condition to end it, as it is a miserable situation for these people who are in a coma, or in any trance like state or condition that resembles a coma, or a sleeping person, who can not wake up. The person is perfectly brain active, and there are no measuring devices to prove it available to hospital staff or to doctors, as none are made, and the technologies to detect a person's brain activeness and aliveness are kept secret after they are bought up, and then after the records of them are destroyed, and the information on them are kept secret and locked away, in vaults, and in storage facilities, hidden from view so that no one can get the information, and build a device to detect a person's brain alertness status.

After they are told the truth, and that you just became aware of it, you are to tell them to not be afraid, and that all measures to relieve them from their present condition, and all measures to assist them to transel to my Epcot Center, where they can recieve personal care, and then helped to recover from the trauma of the coma, or coma like state of not being able to wake up, speak, and talk to people. They are then to be injected with a powerful sleep sedaditive, or induced to swallow several strong sleeping pills, as they may become afraid, and then, you are to help them to pass on, and to transel over to my Epcot Center.

In some cases, if you pull on the large toe of a person, or on the thumb, the person may have control to pull in the opposite direction. That is an indication that they are awake, and fully aware of what is going on around them. Please check patients to see that they have soundly fallen asleep, and snoring or breathing quietly, in relaxed manner, may be the only sign that the person is asleep.

Any sign of movement, mentally driven by the patient, no matter how slight, is nearly most always, nearly one hundred percent of the time, a sign that the person is completely brain alive, and that the person is completely aware of what is going on around her or him and can hear every thing. Even passing or expelling gas or farting, can be 'mentally' driven, and a sign the person is awake, and alert, and brain alive. Opening one's mouth is almost always, one hundred percent of the time, mentally driven.

Persons's in a coma, who have Eplilepsy, or other similar brain or neuro muscular disorder, and other conditions where patients experience spasming, whether the condition is diagnosed or not, these patients who spasm, may make some spamodic movement, now and then, and that is only a sign that the person is haveing a neuro muscular muscle spasm. Knee jerks or other similar movements, are not always muscle spasms and can be labored, mentally driven actions. These actions show the patient has control to that extent over her or his muscles, body, skeletal system, and other body systems related to the movement.

In any case, after the patient has fallen asleep, you are then to kill the person, and let the person transel to my Epcot Center, so that the person can recover in my Epcot Center, and then be born as a tummy baby, to a tummy mommy, and to tummy daddies.

All Persons Who You Kill Will Transel To My Epcot Center

Once you are certain all of the police, fire, teachers, and all others who support the Lesbianists' societies around the world are dead, they will transel to my Epcot Center.

It is now the time to bring an end to the lives of these people who support the crazed, insepient, bogus Lesbianists, and to destroy them all, leaving no survivors. Kill all of their family and relatives, and leave no one alive. Kill them all.

My Epcot Center will not be in any way, inconveinced by your brave and heroic actions. All doctors must be killed, all nurses must be killed. All medical techinicians must be killed. All library workers must be killed. All school teachers must be killed. All art museum and gallery museum workers must be killed. All workers for all of these institutions must be killed. All of them, in every country of the world, unless they surrender and plead for mercy, and then are allowed in to my kids' place, for swearing in and for joining as civilians, my country.

Further, it is time to kill all media corporations personel, such as news casters, news men, news women, anchor persons, cameral men and

women, talk show hosts, administrative persons, Hollywood's movie actors and actoresses, all radio broadcasters, and all personel of all radio companies. It is time to kill all news paper company owners, and publishers, editors, and all workers of these companies, unless they surrender to my children and plead for mercy.

It is time for all of you to kill all of them, and make sure not one of them is left living, including and most importantly, all politicians, who must all be killed, without any further delay. It is time to kill them all.

It is now time to kill Oprah Winfrey, Geraldo Rivera, Sarah Jessica Parker, Judge Judy, Jerry Springer, Liz Taylor, Michael Jackson, Clint Eastwood, Cher Bonno, Morgan Freeman, Steven Spielberg, Al Gore and his family, Hillary Clinton and her family, all of them, Jeb Bush and his family, all of them, Nancy Reagan and her family, all of them, former president of the United States President George Bush, Sr. and his family, all of them, including all persons related to him in any way, and all persons who work for him, in any way, and all persons who work for any of his associates, in any way, unless they surrender to my kids, and then plead for mercy.

We are not going to allow the Lesbianists to continue their illegal, inhumane, and horriblesome practices and activities on my planet, and in my universe, a moment longer. They must all die, now.

Is that understood?

I hope the answer is, "YES SIR! Mr. John Francis Ayres, GOd", as a 'negative' reply to my question is not acceptable.

Japanese And List Keeping

I haven't confirmed it, but from what I know, so far, the Japanese are very good at keeping lists, and they know about all the foreign people in Japan, and they keep lists of names of all of them, and they keep lists of names on all of the Korean people, and the Singaporean people, the Chinese people, the Ainu people, and the cast outs or 'burakumin' a group of meat cutters and fish sellers who some how got on a list of people who were felt to be 'unclean'. The 'burakumin' was a group of people who no one in Japan wished to talk about. The Japanese also, apparently, had lists on groups of people, who they didn't know much about, but they knew they were always doing things with each other. Those groups of people were the Lesbianists, so the Japanese knew all along, who I was talking about and were nearly one hundred percent certain those groups were the Lesbianists living in Japan.

They read what I wrote, and the notes of mine were passed to many people on an e-mail mailing list, and when they heard that Steve Irwin had been killed, they felt they had heard enough and they told all their friends about my notes, and then the Japanese killed all the Lesbianists in Japan on that list they kept.

It's something I heard, and I haven't confirmed it, but I think the Japanese are fully capable of handling that, as they were fully prepared to deal with each one of the Lesbianists, and they knew who they were, and once the Japanese united, and decided to take action. The Japanese escorted all the Lesbianists to a meeting place, to which the Lesbianists were not happy to go to, but had no choice but to agree to follow the Japanese citizens who escorted them there, with the military or Japanese Self Defense Force, the Coast Guard, and National Police, and all other police agencies in Japan, plus the national organization of fire department workers, backing and supporting all the Japanese citizens.

As to what they did with the bodies of the Lesbianists, I'll leave that to them to explain to you, as it was quite brilliant and they had many very good ideas for dealing with the bodies of the deceased Lesbianists, who are apparently now in my Epcot Center.

The Japanese country side is now peaceful and quite, and things the winds are blowing, peacefully, and gracefully over the Japanese country side, cities and towns, across the ponds, marshes, lillies and lotus flowers swamp lands, bogs, bays, estuaries, lakes, streams, rice paddies, fields, mountains, and islands, from what I can understand and gather about the situation in Japan.

Surrendering And Pledging To Serve All People In My Universe

If the Lesbianists and their supporters surrender to my children, and then promise to devote their lives for the sake of others, serving man kind, and all human beings, and all people on this planet, and in my universe, for the rest of their lives, they will be allowed to surrender to my children, and my children will then arrest them and put them in a prison cell. If they are not willing to serve others, despite the fact that they say they will serve others and devote their lives for the sake of others, serving all people in my universe, then my children will ignore them, and my children will not arrest them because my children know they are lying. They must promise to do all they can that is humanely possible, for the sake of others, and devote themselves to the prosperity of others, for eternity. If they are not willing to do that, then please, just send them on to my Epcot Center, and we'll straighten them out, for there. My staff at the Epcot Center has training programs to straighten them out and make them nicer people, so that next time they are born as tummy babies, they will behave and be nice to others, doing nice things for other people, after they are retrained, a little. The retraining program takes a while, but the results are very good to excellent.

If my kids decide that the person who is surrendering, is telling the truth, my kids will use the special teletransportation technology, something like what we see in Star Trek on tv, with Captain Kirk saying, 'Beam me up, Scotty!', as many of us have seen on daytime tv, or in the movie theater, and my kids have very good teletranportation technology or 'beam me up, Scotty' technology, and the person, once he or she pledges honestly to serve others, will instantly dissappear.

Do not be surprised if when the person surrenders and promises to 'serve others', promising to devote her or his life for the sake of others, the person suddenly dissappears, and instantly, the person is no where to be seen. The person was 'beamed' into a prison cell that my kids have constructed, using other technologies, and we have many prison cells waiting for the Lesbianists and for the Lesbianists' supporters, and for other bad kids in my universe, as well.

For each person you kill, my kids will keep earning points scores on your efforts to send them to my Epcot Center, and you will be paid, when you have finished your job, and then finally, go in to visit my kids. My kids will pay you in the monetary currency that is used in the underground cities my kids have built, for protecting people from these horrible Lesbianists and for protecting people from the abominant kids of mine, and the ghastly and naughty animals and very large bugs and spider like creatures, that the Lesbianists use to help them torture people with, to make the Lesbianists laugh, and to amuse themselves, as I've explained a little about, already. The more Lesbianists and Lesbianists' supporters you send to my Epcot Center, the more earning points you will score, and the more money you will earn, and you will be paid that money, when you go to visit my kids after you have finished your work, killing the Lesbiansts and the Lesbianists' supporters.

If the Lesbianists and the Lesbianists' supporters do not disappear after they surrender, and after they promise to serve others, and pledge to devote their lives for the sake of others, the Lesbianists and the Lesbianists' supporters are lying, and you can then kill them, and send them on to my Epcot Center.

My children will escort the deceased Lesbianists and Lesbianists supporters, once you kill them, into one or an other of my Epcot Centers, and will make sure that the Lesbianists and the Lesbianists' supporters get in for a meeting with one or another of my managers, or with one of the staff members who work with my managers to arrange retraining programs for rehabilitating the Lesbianists and the Lesbianists' supporters.

The Lesbianists and Lesbianists' supporters will not qualify as tummy babies, until they are finished their retraining and rehabilitating programs. After they finish, they will be out, again, to join the rest of you, once again, but this time, as nice, kind, courteous, and polite people.

What Does This Mean?

It means, I want all the Lesbianists dead, but if they will surrender, and if they promise to serve all human kind, all people, and work and strive to enrich the lives of all others, dedicating their lives to others, then, you do not have to kill them, and you do not have to send them to my Epcot Center. If they are honest when they surrender, and when they promise to serve all people, devoting their lives to all people of the world, then my kids will 'beam' them in, using the

teletransportation technologies that my children use. If they are lying, then my children will not beam them in, and they will be stuck where they are. If they are stuck where they are, after they surrender to my kids, and after they promise to dedicate their lives to the welfare of all others in the world, and to all others in my universe, then they were lying, and you may then kill them, and send them on their way to my Epcot Center, for retraining, and for rehabilitation.

It also means to kill any person who works for the Lesbianists, if he or she is supporting the Lesbianists to try to stop you from killing the Lesbianists. Also, it means that you should kill any person who tries to interfere with you, while you are trying to kill the Lesbianists.That's what it means.

And Children

Fermenting Oils - Fracuses Kiddies - Slugs, Snails, And Other Bottom Feeders - Feeding Everybody In Our Bodies - Putting An End To The Global Menace Of The Lesbianists - Changing Our Societies, And Our Universe, Forever Updated: 22-01-07 Rev.x.00.a 07:45 PST

Mix raw sugar, ocean salt, sessame seeds, dried fermented berries you have taken from a mix of berries fermenting as a flural hydrate liqour, or as a plain fermenting liqour, and make sure you dry them out in the oven, before useing them.

Mix the items together in a container, and mix in a drop or two of apple juice, pear juice, papaya juice, kiwi juice, banana juice, cherry juice, cranberry juice, strawberry juice, peach juice, nectarine juice, or plumb juice, and let the moisture settle into the mixture to allow it to become only partially and only very slightly moiste, and not wet or liquidy.

Allow the mixture to sit in a warm or cool place for a week or two, to eight to fifteen weeks, or even a few years, and it will grow molds in it, and with the longer the duration up to a point of sitting and molding, the more useful it will become.

It might develop a pungent, unpleasant odor, like a dead animal smells, which may mean that a fungus that is not very suited for you to use as a starter mold for starting a fermented oil batch has developed in the container, and in that case, you can throw the whole mix out, or use it for fermenting beans or something. Cheeses can be made with these kinds of growing funguses and molds, if you are the daring type, who likes to experiment with new and different tastes from variously fermented mixtures.

You can add some ocean salt, and make a soury vinegar, and then try to rescue it with the combination of the soury vinegar, ocean salt, and a

little raw sugar, and some honey.

It may be that some bacteria is in the mix, and it needs to be eaten up, before you can use it safely for a healthy mold mix for starting a nice cheese molds and funguses mixture.

Ocean salt can be added in slightly large amounts with raw sugar. Once the odors have stabilized, and once they have developed a more pleasanty odor of a fermenting mixture, with a slight alchohol ferment odor that will indicate that it is alright to use, and that it will not be harmful to you.

In some cases, the bacteria in the base mix, may be a result of hairs or particles of skin from the body of a dead rat or mouse, that some how found his or her way into the sessame seeds, or into the dried spices, or into dried berries that you used, and then died.

In that case, you might as well throw it away, unless you have a lot of patience, and do not mind waiting and working with it, for several years, for it to become something you can use.

One way to make it into something you can use is to mix in a high potency liqour brew, and let it sit for a number or years, and ferment it, and then after it smells nice and rosy smelling, after ten to fifteen years, to thirty to fifty years, you can evaporate the liquids out in a pail on an open porch that has a net covering to keep animals and animals' hairs out of it. Make sure there is good ventilation, and it should evaporate out, safely after a number of days on the porch in the sun. If there is no heat to make it hot enough to combust, and if there is good ventilation, it will not combust, and it will evaporate out, safely. Adding ocean salt and raw sugar to the mixture so as to fill it up with raw sugar and acidic ocean salts, will further help to safely evaporate out the liquids and prevent the liquids from combusting, accidentally.

Once the liquids have evaporated out, safely, you can use the materials that remain in the pail or container, to start a fermented oils brew mixture, or to start a cheese molds and funguses mixture, if you wish to make a nice cheese molds and funguses mixture.

The particles of skin or hair from the dead rat or mouse, or pidgeon, or other animal, will have been eaten up by all the ferment fracuses kiddies, and will no longer pose a threat to your health.

Fracuses Kiddies

Ferment fracuses kiddies are just plain old ferment kiddies who like to devour large bits of human or animal tissues, mites, or cockroaches, or their body parts, and then poop them out, and pee them out into the liqour brew.

You'll always have some of these kiddies in your brew mixes, and they are useful to you, as they eat up the things that you do not want in

your tummy. Also, there are other kiddies, such as snails, and other bottom feeders, that find their way in, in the skins and pulp material as tiny animals, or the eggs of animals, and they hatch, and they develop, and they grow big, and they then bottom feed, and they eat any dead rats, and dead rat parts from rats that might have fallen into the brew. These are useful pets, that you want in your rum and liqour brews, as they will keep the liqour brew healthy to drink, and they will keep you from getting ill.

Slugs, Snails, And Other Bottom Feeders

In the old days of bucanneering, as I may have mentioned, before, this was a crucial part of keeping the sailors alive, on their long voyages, and if crew members fell ill due to an unhealthy brew, with a dead rat in the mix, making it sour, and making it unhealthy to drink, then if there are not enough snails, slugs, and bottom feeders in the barrel or rum to eat the dead rat parts, the sailors will get ill, and when they get back to port, they will hang the rummery owner, and give the business over to the son, or to a third party, often times, one of their fellow crew members, who is liked by all the people, locally, and on the ship.

This is the case, still today, with many rummeries owned and handed down in the same family, from such instances as that.

Bottom feeders, slugs, snails, and many types of bottom feeding earth worms, and other types of healthy bottom feeding worms, that cohabitate well with the slugs, and snails, and other animals that are too tiny for you to see in the rum brew mixture, without a powerful microscope like, optical videoing technology, are essential to your brews mixtures, and they may increase in numbers as they make babies like every animal and living being does, and so now and then, you need to reach into your brew container, with your hand, or with a fine mesh small aquarium use fish net, and scoop them out, and flush them down the toilet, or let them loose in a local pond, lake, mountain stream, or water springs fresh water well, where they will help to keep the water clean, ahd healthy.

Once you have the materials to make your fermented oils mixture, you can add them to your container of food oils, and begin to ferment them, or use them to make a nice cheese mixture, to ferment and then to make solid as it matures with age. You can also use the materials to make a fermented bean mixture, or fermented barley, or fermented rice, or fermented millet, or fermented wheat mixture.

You can also use them to make a fermented brew mixture, as there will be many healthy molds and funguses kiddies in and among the dried out materials. Your health will improve, and by adding different spices, nuts, berries, root particles, ground up kiln dried pine cones that were green to begin with, and then fermented for a few months to a few years, in a brew mixture, then dried out, and ground up into a saw dust powder consistency, you can then have lots of crystals cages

salts kiddies of various kinds help you to make a nice regroverative brew, to help you to regroverate your amoebes.

Feeding Everybody In Our Bodies

You know, we need to eat foods to stay alive. We also need to feed all the living animals in our body, to help them to stay alive, so that they can help our health remain normal, from day to day. We also need to feed the amoebes all the foods and juices, salts kiddies, and the poopy liquids and pee liquids, and other liquids with other types of tinier salts kiddies in them, as well as other types of food kiddies, we haven't learned about, yet, but with all of them inside your tummy, you'll be able to feed every one who needs feeding, and then you'll be successful with your amoebe 'auto regroverate mode, on!' formula, so long as you have degunked your body of all the petro chemical oils, kerosene, diesel fuels, and other chemicals, the Lesbianists have been feeding you, from birth, in your diets, if you live in a society, where you are fed baby formula mixtures from Gerbers or Heinze, or any of the other baby foods manufacturers.

Putting An End To The Global Menace Of The Lesbianists

We need to put an end to this practice by the Lesbianists of poisoning us with their petro chemical industry oils and tars salts kiddies, which they use to rot our teeth out, and cause tooth decay, and which they use to cause ulcers in people's tummies, and which they use to cause lots of unpleasant illnesses, and diseases in human beings, and in farm animals. These petro chemical salt kiddies, and formaldehyic salts kiddies, all harm our amobes living beings children, and all the other animals that live inside of us. One day, we will have a lot of people practicing my religion, sexaling, and making prayer statements so as to help us to erase the karmic markups we have, that keep us living under the tyranny of these Lesbianists, and in their societies, suffereing the daily poisonings that cut our lives short. When we have erased enough of our karmic markups with my religion's religious practice of sexaling to purify our selfs and others around us, and to clearify and erase our karmic markups, we will eventually be able to say good bye to the Lesbianists, and their practices of poisoning us, and causing us major headaches, or problems in our lives.

Changing Our Societies, And Our Universe, Forever

At that time, we will be able to say hello to a whole new way of life, and that will be the beginning of our new, thrilling, and excitingly challenging, one world, unified, planetary, global culture, and it will be the begining of our new, thrilling, and excitingly challenging, one universe, universal culture for all of the people in our universe, who we have been living in our universe together with, since we first came out, and began living here in my universe, a very long time ago. We have to start somewhere, and so here we are, now, begining to prepare the foundation for our long and prosperous journey ahead of us, as we clean up our universe, together with each other,

and clearify and erase all of our karmic markups, and all of the karmic markups of all my children, and of all living beings who live with us, together with us, in my and our universe. We need to take responsibility for this clean up campaign of ours, as we are the only ones, besides my many worker, unionized children, who can use our brains, and use our sexaling organs, to produce purifying energies of all types, to help us clearify and erase all of our karmic markups, and all karmic markups, and karmic things and dings, of all of my animal children, and of all of my living beings children, and of all of my human children.

My kids have built underground cities, to help us to get started, in learning about the new ways of living together, and of sexaling together, for practicing my religion together with each other, so that we will be able to prepare ourselves, for our new global, unified society, and for our new, universal, united, civilization. We have a long ways to go, but we are starting now, with your efforts to correct this situation by eraseing the karmic markups and karmic things and dings, that have us living in this truly awful situation on this planet, in our universe, that we are now, curently living in. One day, when all the Lesbianists are either dead, or have surrendered to my kids, we will be able to gradually educate ourselves, and change our understanding about women and girls, and about men and boys, to understand the truth about women and girls, and about men and boys, and then we will begin our new and exciting journey into our future, together, with my religion at the basis of our new, unified society, universal culture, and universal civilization.

Donations To GOd - Monastic Mode - Who Works For Me, Anyway? - Obeying Orders - Every Politician In The World To Be Executed - Every Hollywood Actor And Actoress To Be Executed - Jump Ship, Explained - Fair Warning - Particle Remis Technology And Particle Dismiss Technology - Dismend Technology And Remend Technology - Mentalcosis / Mentaltosis And Comatosis - Michael Jackson - Retractions Updated: 26-01-07 Rev.b.02.a 06:45 PST

Donations To GOd

Why can't anyone donate any thing to me? I am GOd. So, how come no one can send me a penny in the mail, or a box of cookies, or a pair of socks, or something? I don't think I'm asking for too much, but I'm just curious about why no one can send me anything in the mail?

I don't get any phone calls. No one sends me any e-mail. No one tries to visit me. I have a religion, and I'm asking people to practice it. Now, how come no one can contact me?

I once said that I am in a monastic mode, and it is a cloistered monastic mode. That means, no one can be contacted out side of my monastery by any one inside the monastery, and no one can contact any one inside the monastery, by any one outside the monastery.

If there is no legitimate monastery business then no person will be allowed to contact me, or for that matter, any one else inside my monastery, who is leading a monastic life, with me.

Well, there is only me, right now, but maybe in the future, some one will be in my cloistered monastic discipline with me, helping me with my religious duties of doing my religious ceremonies, as I've mentioned about, before.

Monastic Mode

What does my 'monastic mode' mean? It means that I am here as GOD. You know, there is only me. I of course never sent any one, such as the Lesbianists claim. Why would I? I don't need any one to do the things I need to do. That's sheer idiocy to think I would have a son or daughter, and send them to do my business. That's absurd. You've been snookered into believeing all those hogwash tales, and now you don't know who I am, and you don't have the karma to believe in me, as a result of your following and believeing all those hogwash tales. My kids are everywhere, and they are doing their jobs.

Who Works For Me, Anyway?

Now, as I've been saying, I'm going to have you do your jobs, and that is to use your genitals, and to use your body, and to use your brains, and then participate in my religion, using your genitals and your body and your brain, and sexalate with each other, and purify your karma? Does that sound like a joke to you? If it does, you are very mistaken because it is not a joke in any way, and I am absolutely serious when I say that you are going to use your 'equipment' and I almost want to call it, your 'field' equipment, because you are armed with it, day and night, and you are going to use that equipment, to clearify and erase your karmic markups, and to purify my universe. Is that okay with you? I hope it sure the hell is, as a "NO SIR!" at this point, would be an unsatisfactory reply. Do you understand me? I hope so. You are going to jump ship, as I order you to, or be thrown over board, if you have a problem with that. I hope you understand.

Well, as far as I can figure it, no one realizes that I am GOD, so no one can donate money to me. If some one realizes that I am GOD, than for the first time, that person will be allowed to donate money to me. That person will be allowed to visit me, or call me on the phone, or donate money or food to me, or practice my religious ceremonies with me, if that person believes, and understands, and realizes, that I am GOD.

Right now, there is no one who realizes or understands that I am GOD. No one of course believes I am GOD. Never the less, I am GOD, and I am sitting here, waiting for donations, to help my ministry get started.

So, that is the reason that no one can get through to me, or donate money to me, or send me a postcard with some kind of message of cheer and support in it.

There doesn't seem to be any body who believes that I am GOD. Well, that isn't surprising. People do not have the karma to believe that I exist, is one way of looking at it. They have ignored my existence, and have not had any real thoughts about me that would link them to me, in my monastic mode.

What does that mean? It means, that no one remembers me, as the guy who created all of you. It also means, that I am in a religious mode, and no one understands that, or believes that I am in a religious mode. That is peculiar, since I am giving you a religion, one of my oldest, for you to practice, that will assist you in purifying your life, and that will assist you in eraseing and clearifying your karmic markups. That's very peculiar, but it is not that peculiar, as you do not have the karma to realize and understand that I am GOD. In any case, there will be no donations, no telegrams, and no phone calls or letters to me, so long as you do not realize, understand, and then of course, believe that I am GOD. Well, any way, so it goes.

Obeying Orders

Now, I want all these people, killed. Hillary Clinton. Bill Clinton. Chelsea Clinton. Ted Kennedy. Al Gore. Tipper Gore. Harriet Gore. Cheryl Gore. Dave Gore. Bill Gore, and all people who call them selfs, Gore and pretend to be related to Al Gore, or to Tipper Gore. Mr. Al Gore has lots of friends, who are also Lesbianists, and I want them all killed. Oliver North. Monica Lewinsky. Eve Arden. Elizabeth Arden. Michael Jackson. George Bush Sr. and all other George Bushes. Do you understand what I mean? It means, that they are all Lesbianists and they are all going to die, and we are going to blow up Washington D.C., and destroy Capital Hill, and level that area, and make it sink beneath the waves of the Atlantic Ocean. That's how big a bomb I want you to make, with my fracturable rocks, to then blow that area out of the water, and make it sink below the waves of the Atlantic Ocean. You'll probably need more than one bomb.

Did you know that Washington, D.C. is lying on a fault line, deep down, and it is on an ocean shelf, that has the ocean under it, lapping at the earth, very far down. That means, that it is on a fault line, and it is on a shelf, that is hanging over the ocean's waters.

Now, if you hit Baltimore, and Maryland, and Northern Virginia, and Washington DC with a large enough bomb to blow Baltimore out of the ground, and level it, and with another bomb large enough to blow Washington DC out of the ground and level it, at the same time, and a few more bombs, large enough to blow Maryland, Virginia, and that whole metro area out of the earth, at the same time, you will sink the nation's capital, that is, Washington DC, below the ground, as it will break off the ledge that it sits on, and it will sink into the ocean, as the ledge crumbles below it. There will be water, from the Atlantic

ocean, all the way out to West Virginia.

Now. I have every right to say that, and demand this, as it is a matter of self defense, as I know these motherfuckers are eating people, cannibalizing my kids, for their amusement, thrills, and fun, and they will continue to do that UNLESS THEY ARE STOPPPED! Do you understand that?

I hope so. I am going to see the whole of Washington DC and the area leveled, with Baltimore, and Northern Virginia, and Maryland, as well, and we are going to sink that area into the ocean, and make it disappear below the surface of the waters of the Atlantic. Now, that should be clear, shouldn't it.

This is not a joke. We will have to send a lot of my children to my Epcot Center, in the blasts that will occur, and in the after math of the blasts, but that is unavoidable.

We will have many people, drowning in the waters that come in from the ocean, and that stretch out to the hills of West Virginia, with only slight outcrops of land, hills, here and there, with a few people lying on top of them, blinded and in awful pain, but they will not live long, as they will not be able to survive for long, and they will pass on, die, and then they will transel to my Epcot Center, where they can get medical relief, medical treatment, therapy counseling, and rehabilitative therapies. That is what we will do to Washington DC and vicinity, so every one, please prepare for it, and get your pain medication in order, so you can take an over dose of pain pills, when your area is blown and shredded to bits, with one or more of my fracturable rocks bombs, as I've explained about.

Every Politician In The World To Be Executed

Next, I want every politician in the world, canceled out. I want their passports for living on our planet, canceled. That means, I want you to kill each and every one of them. Not only do I want you to kill them, all, but I want you to kill every single one of their associates, around the world. They are all Lesbianists, except for a few of them. If you happen to kill one of the non Lesbianists policitians by mistake, that is okay. They have the option of surrendering to my children, available to them, and once they surrender, they will not be killed, by accident.

Every Hollywood Actor And Actoress To Be Executed

After that, I want every Hollywood actor or actoress killed, and that includes all the actors and actoresses, around the world, and they must surrender to my kids, if they wish to not get killed. There are a lot of them, who are not Lesbianists, so those I've mentioned, who I've let you know are not Lesbianists, you can forget about them, and leave them alone. There are a lot more than thirteen billion Lesbianists living under the earth's surface, in underground cities. I did not realize there were so many. We need to kill them all, so we

will, in time, unless they surrender. Is that clear, every body? I hope the answer is, "Yes, Sir!" as you had better not answer any other way, or you will get yourself on my shit list. Is that understood? Good. I am the boss of my universe, so if you do not like it, than jump overboard, now, sailor. Have you got that clear? Good.

Jump Ship, Explained

What does 'jump overboard' mean? It means you are going to have severe problems with me, if you do not obey orders, and that there will be difficulty and jail time, ahead of you, if you continue to ignore my commands to you. It means there is going to be trouble, if you do not obey me. My kids are in charge of handling all the details on that, and it is not a joke.

Fair Warning

We are not going to let these Lesbianists run their show, one more minute. We are going to put an end to them, and their activities, here on this planet, and every where else in my universe, and this is fair warning of that.

Particle Remis Technology And Particle Dismiss Technology

As I said, once before, there is a technology called particle remis technology. There is also a technology called particle dismiss. They are the technologies that you can use to feed 2.3 billion Lesbianists down under the surface of this planet, and on every other planet that they are on.

Dismend Technology And Remend Technology

It is easy to dismiss molecules, and to dismiss, or dismend all the beings who need to be dismended, and sent to my Epcot Centers. It is also easy to remend them, and then get them back into the foods that I need them to be a part of.

My kids keep track of every one who needs to be dismended, and then remended. That is a lot of work, keeping track of every one, but that allows us to dismend the living beings, and animals, that I can let off from duty, and from further service, and then send to my Epcot Centers for them to live in. I can then recall them to duty, and remend them, and then have them serve in an apple or an orange, or banana, or a brick. Do you think that is a joke? It is not a joke, and there is no joking allowed, on my shift. Do you got that? I hope so, because if you do not, you will have to learn how to swim a long ways, as it is going to be a long way from shore, after I ask you to jump over board, and I have sailors who practice, all the time, just to show the passengers how it is done, just in case. I will have you jump from ship, if you do not get along with me, and if you disagree with what I am doing, pretty soon, as we are departing, now, or just about now. That means, we are not going to play around, much longer, and we are going to set sail. That means, there are going to be a lot of

people practicing my religion, pretty soon, as they will learn about it, and they will begin practicing it.

Mentalcosis / Mentaltosis And Comatosis

Mentaltosis is the state of a vegetable, like a stalk of cellery, or a plumb, or an orange. Comatosis is the state of complete awareness of self and others. Comatosis is not brain dead, i.e., more or less, mentaltosis, with no real significant brain activities occuring, other than the ones that keep you alive, and vegetative, and you do not need assistance to remain and function in a state of mentaltosis, and the Lesbianists know it. You are severely brainally handicapped, and when you come out of it, eventually, after you have your karma fully completed for being mentaltosically ill, and after it is then time to get on to something else, you will be very brainally handicapped, and you'll be an extremely retarded person, with little to nearly no brain awareness going on about self and others, but able to walk, barely, and later, after many many lifetimes as a mentally retarded individual, you'll begin to be able to mumble a little, or babble a little, for umpteen lifetimes, as you begin to get your higher brain functions, back, which takes a very long time to work out, and many many lifetimes to work out, karmically.

Comatosis is like a hit on the head, and when you wake up, your faculties are not all working, and you may not be able to speak, or move, or talk to your friends, but mentally, you are all there.

Mentaltosis is like a train ran over your brain, and every other nervous system in your body, nearly, and you are completely unable to think, or do any thing else, and you are reduced to a mere pumping heart patient, with not much else going for you, except you are breathing, and technically, you are alive. You can sit there for a million years, or a million or so life times, before you begin to come out of it, and then reveal your disorder of severe mental disorganization, mental disfunction, and mental retardation. There is a big difference between a bonk on the head, and a train running over it, and the rest of your body. Coma patients are fully aware of what is going on around them, and they may not be able to speak, but they are there, and they can twitch a finger, now and then, or flex a toe, or raise their tummy up a tiny bit, to pass gas, usually, and relieve the bloating sensation they are experiencing in their tummy, and in their intestines, or colon. They may be able to grasp your hand, and fully hold on to it, and not let go, for hours, if they have the strength for it. This horrible torture the Lesbianists are perpetrating on comatosic patients, needs to end, now. Person responsible for continuance of hospital policies, despite our informing them of the truth regarding this, are to be shot and killed, and sent to my Epcot Center, if they interfere with the removal of the life support and life support assitive devices, that are plugged into the comatosic patients mouth, or nose, or other orifice of their body, or any part of their body. If some one refuses to cooperate, you are

to throw them out of their hospital unit, and give them a good whack on the head. Come back in a few days, and then disconnnect their life support assisitive pumps, and tubes, and so forth, and shoot them in the brain with three 'fivers', as I've explained about, and then send them on their way to my Epcot Center. That is an order. Now do it.

I want you to pull the plugs on all the GI's and civilians who are on a breathing assistance machine, and life support assistance equipment, and I want you to send them all to my Epcot Center, where they can get treatment, and therapy, and then get themselves ready for being born, again, as a fine and a healthy, tummy baby to a tummy mommy, and to tummy daddies. You had better comply, if you know what is good for you, as my kids are now keeping track of your records on this account, and you are not going to do very well, if you do not follow orders. Is that clear. I will not have any insubordination of duty on my watch, and that means, you had better learn to follow orders, or you will be asked to jump over board, and then go for a very long swim to shore.

Michael Jackson

Michael Jackson is the biggest joke in the world. He is a white boy, and he pretends to be related to Janet Jackson, a black woman, partially, and they pretend to be related, and he is as white as an elbow macaroni, or a white goose. He is not a black person, though he does have some black ancestry, but he is a primarily white person, and he pretends to have bleached his skin color, which is a crock of shit. Now, I want you to kill that mother fucker, as well as Sylvestor Stallon, and Arnold Schwarznegar, Clint Eastwood, Morgan Freeman, Kirk Douglas, Matt Damon, Robert De Niro, Anthony Hopkins, Gary Busey, and their Lesbianists' buddies.

Retractions

Mr. Jerry Springer is not a Lesbianist. I was mistaken about him, as he was already killed by them, in a previous lifetime, as he developed a desire to bad mouth them, and they didn't like him, and they kicked him out of their group, and they killed him, with their murderous torture routines. Penelope Cruz is not a Lesbianist, but she was, but they killed her, and tortured her, and she is off the list. Angelica Huston is not a Lesbianist. She was, but they killed her, after torturing her. She is a popular and prominent person, and if she hasn't been abducted yet, by the Lesbianists who will feed her to my abominant kids, like they did to Steve Irwin, and Jeff Corwin, then they will be gettting around to it, not too long from now, as they like to feed her to the abominant kids of mine, just as they do Bill Gates, and lots of other, former Lesbianists. None of the Baldwin brothers are Lesbianists, either, as they were already kicked out, and killed by them, and then grievously tortured by them. They continue to be main attractions for feeding to my abominant kids. Jack Nicholson is not a Lesbianist, now, either, but he was. Ben Affleck is not a Lesbianist, as he was also kicked out of their organization, after they tortured and killed him. Charley Sheen is not one, either, but he

was. Martin Sheen is not a Lesbianist, but he works for them, and he was one, before they kicked him out, after they tortured him, and killed him, in a previous lifetime. Michael Douglas is no longer a Lesbianist, either, as they killed him, after their brutal torturing of him. He is up for being abducted, and for being fed to the abominant kids of mine, as he is a prominent person, and Kirk Douglas enjoys watching him get eaten up, and Kirk Douglas will laugh his guts out, as he watches Michael Douglas get tortured by the Lesbianists, which Kirk Douglas is a confirmed member of. Cher Bonno is not a Lesbianist, as I was mistaken in memory, though she was a leader for a while with Oliver North, she was killed by them, after being tortured, because she was getting "soft". Sunny Bonno was a Lesbianist, as well, but he was also killed after being tortured, officially kicking him out of the members league of Lesbianists. Sunny Bonno was captured, and abducted, and a body double was placed on a coroner's table, and Cher Bonno knew that the body double who was dead, who looked like Sunny Bonno, was not Sunny Bonno. The Lesbianists subsequently fed Sunny Bonno, after they captured him off the ski slopes, to my abominant kids. Elizabeth Taylor was thrown out of the corp of Lesbianists, after they heinously tortured her, and murdered her, and the Lesbianists have her slated, scheduled, after they find a way to abduct her, for feeding her to my abominant kids. Dennis Miller is not a Lesbianist. Though he was one, after torturing him, and sushi-izing him, please see my notes on that, the Lesbianist's sushi-izing of Dennis Miller eventually killed him.

It's hard to keep track of some people, as to whether or not they are currently Lesbianists. Others, are not so hard to keep track of, and I want all of those mentioned, killed, immediately.

Captain Off The Bridge.

On Praying, Fucking, Sucking And So Forth

You are rewarded for praying Nam Myeo Ho Ren Ge Kyeo. You are also rewarded for fucking, sucking, tounging, licking, fingering, dicking or massaging your dick against a woman's bun bun, or inside of her butt hole, where there are lots of sensitivities buttons that get her clicking and eroteming and orgasming, or against her titties to get her eroteming and orgasming, and so on, and for palming or massaging a pelvital button, or the love and joy stick, the dick, or a love button or love patch, igniter switch, or whatever nerve sending touch sensitive love joy button there is embedded into your body, in the pelvis, groin, vagina, and in the musculatures of the groin, pelvis, and vagina, with the palm of your hand, and so on. You also get rewarded for throating a woman with your dick, as there are lots of love buttons in her mouth, and throat, lips, and so forth. Men also have love buttons in their lips, throats, tounges, mouths, butthole, and on their body, and those buttons also get clicking, and turning on and off, and sending sensitivities messages or signals, nerve pulses,

up the eroteming nerval system and up the orgasming nerval system. You get rewarded for dicking men and boys in the throats, and in the buttholes, and their bodies, just as you get rewarded for dicking women. There is no discrimination in this area, and every one is equally rewarded for their meritorious acts of dicking others, women, girls, men, and boys.

Why are you rewarded for praying Nam Myo Ho Ren Ge Kyeo, and for dicking, fucking, and sucking, bumbeying, or moving your vaginal bumbey package against a woman's sexaling body parts to erotemize your self, and the woman, and for breasting your titties, i.e, rubbing your titties against or flopping them against and massaging them against a woman's butty butt or against her other sexaling body parts to get you and your friend sexually erogenized i.e., sexually stimulated, erotemized, and orgasming, and for other sexaling activities that help you and your friend and friends to produce purifying sexaling energies?

You are rewarded for your praying and for your fucking, sucking, dicking, and so forth, for helping to get every thing and every body going at the right pace in synch with every thing and every body else, for every body in my universe who is working for me, to keep them moving in harmony, perfectly meshed and in synch and in a timed persuasive mosture, with each other, so as to keep my universe standing up, strong, wholesome, robust, healthy, well, and fine. You are rewarded for praying as well as for sexaling, as you help move my children along as they do their work, as you pray and as you sexal and spray out energies from eroteming, from erotistically orgasming, and from sexually orgasmically convulsing, i.e., phlumetting, while you shatter out and spray out purifying energies in all directions, that will clearify and erase your karmic markups, and the karmic markups of others, all around you, for millions and more of miles, way out beyond where you are activiating and religialing, i.e., sexaling.

Your dicking, sucking, licking, titty massaging others, and so forth, will get wonderful and wholesome, GODLY, purifying energies shooting out of your bodies, and the energies shoot out at rates of speed that also help my universe to keep synchronized, and to move along at the right pace for it to be able to stand up and remain stable and solid, durile, strong, wholesome, pure, and a nice place to live in.

Every one who works for me, has a rate of speed they work at, a life pace, or life spin. We all have a pace of life. In some cities, it is fast and hustling. In some places, it is slow and whimsical. My kids work according to a rate of speed that is metered, and they keeps every one moving as best as they can, according to this metered pace. The metered synchronized pace that my children work at the rate of is one thirty seventh and one fifth, approximately, on the metronome.

If you help to push my kids along at that rate of speed, or a rate of speed that is close to it, as you pray at a metered synchronized pace and rate of speed, and as you fuck, suck, and so forth at a metered

synchronized pace and rate of speed, then you are rewarded with angel dusts, or purifying energies faerie dusts that my kids daub on your head, and throw buckets loads of over your head and body and that they wash your insides out with and that they wash your body, inside and outside, with as they shower them all over you on the outside of your body, and all around in your body on the inside of you, which then help to clean you up and clearify your karmic markups, cleanse your karma, and purify your life, making you a shining, radiant, pure and holy being, though you may not notice at first, as we are too filthy, karmically speaking, to notice the changes, as our karma is too thick and mucky to allow us to feel the changes that are taking place in our karma and life.

I have a gradient scale for how close you keep people moving, and at what rate of speed you help to push them along, and as you help to push my kids along, so that they can do their work, you are rewarded, in accordance with my gradient scale, with more angel dusts or purifying energies for better preformance, and with less angel dusts for poorer or less effective performance. You have to do some thing that will help my kids move along at a metered pace, so that they can get their work done. Praying Nam Myeo Ho Ren Ge Kyeo sets off a time frame synch. A time frame synch is the metered click, click, click, of the metronome. This time frame synch or metered pace, that you achieve while praying, Nam Myeo Ho Ren Ge Kyeo, will help keep every one moving, at the right pace, if you pray it in a rythym and at a rate of speed that will synch up with a metronome at one thirty seventh and one fifth, approximately. Your efforts to help keep my kids working and moving at a consistent rate of speed, will get rewarded, thus for praying, Nam Myeo Ho Ren Ge Kyeo, you are rewarded, with purifying energies, that my kids dump on you.

Your efforts for fucking, sucking, licking, tounging, titty whipping or banging your titty nipple against the vagina of a woman or girl, dicking, fingering, palming, and so forth, all get rewarded, if you try to keep every thing in synch with the metered pace of the metronome at one thirty seventh and one fifth, approximately. The gradient scale also applies, of course, as you are fucking and sucking, etc., so the better the job you do of keeping your pace at one thirty seventh and one fifth, approximately, the higher your rewards will be. Your rewards are the same, more or less, for both praying and for fucking and sucking, and my kids sprinkle and dump angel dusts, purifying energies, on you as a reward. You also get markups that are meritorious, and you are rewarded with a better and happier life.

Further, when you are orgasming, and eroteming, or pushing out energies as you orgasm, and erotem, you will be pushing out energies that shoot out at consistent rates of speed. These rates of speeds of these energies are in concordance with our pace of life, they all perfectly mesh with the paces of life that my kids keep. The energies as they pass out, and push along through time and space, at synched up

and consistent rates of speeds, all help to keep my kids moving along as they do their work and tasks, and they all help to keep our universe, standing up, strong, healthy, wholesome, well, and fine.

Chaos breaks the legs off the foundation to our universe, and our universe begins to creak and moan, as it begins to crumble, slide, twist, and tumble downwardsly. Making chaotic noises, and chaotic movements, detracts from the harmonics of our universe. Your breaking glasses, and breaking skulls, and legs, and arms, are also chaotic events producing, in most cases, and they will detract from the perfect synch up of our universe, as leg bones and arm bones, skulls, fingers and toes, begin to splinter, as you apply pressures to them, you get negative markups for your actions. A record is kept of every chaotic action you take, or make, and if you make enough chaos, in your lifetime, and in your following lifetimes, then you will suffer from your poor records of performance for keeping my universe standing up, wholesome, healthy, happy, and well.

Every scream you cause to be vocated or vocalized, is recorded, and the intensity of the scream, and yell, and crying out in pain, plus a lot of other factors involved, are all recorded by my kids, and you get negative marks for that kind of performance.

The love making oooohs, and aaaahhhs you cause to be vocated, are harmonic appeals of soothing restfullness to the spirit, and to the mind, are also graded, and you are graded on how well you can cause others to produce them, and your scores are kept, and if you are a lousy performer, with more negatives than positives, you'll end up with a lousy life, as a result, as you are rewarded in accordance for your positive performance, as well as for your negative performance.

Helping to keep all of my children working in harmony, and doing their jobs and tasks, at a metered pace, will be rewarded, not only with angel dusts, but also with a better life with more positive fortune, as you recieve positive points or merit points for your collaborating with my children, and working to support them, and more fun as your life becomes graced with more positive merits and as your rewards begin to pile up, and more good things begin to go on in your life.

If you sit on the side of your chair and have a pair of drum sticks, or are using a bongo drum, or calypso drum, with the long tube belly, or stack, a long barrel tubed drum, or if you sit at your drum set, or set up your electronic drum pads, and begin pounding away, in a syncopated manner, for your pleasure, just drumming away, with no notion in mind as to any thing other than achieving a nice rythym for you and your friends to listen to, if you happen to be with friends, your merit points will be near zero, and your efforts will not rate on my gradient scale, as your actions will not be in accordance with my program for a better universe for all people, and for my kids to live and work in.

If, however, you have the attitude, "I wish to support John's kids, and syncopate myself while I'm drumming, so as to be supportive of John's kids, to help John's kids work in a syncopated manner, doing all I can to support John's kids", then, your merit points as you drum, will go sky high, through the roof, and you'll get meritorious benefits for your efforts, or merit points, and good marks, for your efforts. It's like helping kindly old women, who are frail and in need of a helping hand and support, cross the street. If you act in a kindly and charitable manner to help support those around you, you get meritorious points for your efforts. These efforts of your's, however kindly, regrettably, though they are kindly efforts, are not the kinds of efforts that we need, my kids and me, need to keep my universe standing up, and moveing strongly. For efforts that support my kids work environment, and that lend a hand to them to help them to get their work done, your meritorious efforts marks will go through the roof, and you'll be blessed with angel dusts, i.e., purifying energies that help to clean up your karma, and erase and clearify your karmic markups, or marks that record your bad and cruel, or negative actions towards others, and towards your self. You can kill your self, and cause grief to others, as a result of your departure, to my Epcot Center, and that rates negative marks and negative points markings or markups for you.

When you try to do any thing, that will help to syncopate my children, and to make my children's working environement more syncopated, and rythmical, with your concentrated mind, and determination to make that a reality, in other words, a prayerful attitude in mind, hoping to make John's children's working environments syncopated, and rythmical, and in rythym with every one elses', i.e., all of my other kids' syncopated working environements, then with that attitude of hopefulness, or a prayerful attitude, than, you are rewarded for your efforts, and determination, and as you drum away, or pound and beat on your calypso drum, or on your metal Bahamian or Tinian, or Haitian, or Jamaican, drums, or on your dresser drawers, if your mom does not mind, as you pound away, keeping your mind set on your determination to keep all of my kids working in unison with each other, and helping them to keep in syncopated harmony, all in perfect flux, and perfectly meshed in timing, with every one else, as they work for me, then your rewards and positive points markups, will be very high, and you'll be rewarded by my children, with angel dusts that they daub on your forehead, and dump all over you, from their barrels they carry full of angel dusts, or purifying energies to clearify your markups from your karmic markup piles, kept inside of your body, kept in storage in the molecules.

If you listen to music that is syncopated to the timing of one thirty seventh and one fifth on the metronome, or closely syncopated to it, you will be rewarded for merely listening to it, and you'll receive faerie and angel dusts, purifying energies, as my kids daub them on your head, and spray them all over you, inside and out.

Your markups are inside the molecules inside your body, but they are also out side of your body, in every molecule, nearly, going way out to the very farthest edges of my universe. We will eventually get to all of them, and purify or clearify and erase all of your karmic markups, the notations and records that my kids keep on you, and on your activities, and eventually, we'll get them all, and your life will then be full of grace and happiness. It will be a long time before we get to all of them, as you and I and every one in my universe, have been here, and enormous length of time.

As you drum, or skip, or dance, or do areobics, in syncopation, with the attitude that you want to keep all of John's kids in step, and in synch, and in unison and harmonicly meshed and in perfect flux with each other, or perfectly meshing with each other, and every one else who works for me, whether you drum, skip, dance, or do areobics, it does not matter, if your mind is set and determined to help my kids, with your efforts, you will be rewarded for your efforts, no matter whether you skip, jump rope, dance, or areobically excercise.

As you sexalate, if you keep in your mind that you wish to keep all of John's kids in syncopated harmony, perfectly in flux, and in unison, just as when you are drumming, or skipping rope, or dancing, or playing basketball, or playing tennis, or badminton, or any sport, with your movements all timed, and in perfect syncopation, when you sexal with the right attitude to keep John's kids in synch, perfectly meshed in perfect accordance and flux, with each other, and with every one else, you will be rewarded grandurally, that is, grandly, or in a grand or very great manner.

Excercising And Activiating To Music Timed To One Thirty Seventh On The Metronome

Music timed to one thirty seventh on the metronome, and one fifth, or as close to one thirty seventh on the metronome that you can get, is okay, and it will help you to dance, play tennis, play sports, do areobic excercises, and other types of activities, at that pace that we need to keep to help keep my kids working smoothly, and you'll be graded on your performance, and on your attitude while you are dancing, or excercising, and the more intently you concentrate and use your mental energies and mental control to stay in synch, and in step, the better will your scores be, and the higher your marks, and the greater your rewards of purifying angel dusts and purifying energies that my working and unionized kids will pour and spread all about you, inside and out, and all over you.

Sexaling itself is a religious act. Yes. That's true. But, if you sexalate with this powerful prayerful attitude, or hope in mind, with your determined mind, and your concentrated mind, as you sexalate, and help others to sexalate, and help others to erotem, orgasm, phlumett, and shatter off wonderful energies from orgasming, eroteming, and phlumetting, your positive points and merit marks, and many other types of scores my kids keep on your efforts and behavior, all of them will go higher than any one can see, way out beyond the furthest

galaxy that you can possibly see from your bedroom window, with your telescope. They'll go out to the futhest edges of my current univerese, and even beyond the barrier walls, holding up our universe, that my kids put in, to keep our universe standing up, stable, strong, and durile or durable and with tensile integrity.

Any action for helping my kids do their work, syncopated, and in unison, and in harmony, will be rewarded, with angel dusts, and with positive marks and score points in your records that we keep on you and every one else in my universe. Your sexaling actions get rewarded, far more than any other activityating, as your sexaling actions are the most needed actions, to keep my universe, pure, durile, holy, sacred, free from negativities, healthy, wholesome, stable, and constantly in a state of improvementing.

Most people go around destroying things, and causing chaos. We, my kids and I, need people who are going to help improve the wonderfulness of our, my, yours, my kids, and all of my other kids, wether they work for me, or not, meaning, all of my guppies, who are like you, my relatively normal kids, as well as all of my abnormal kids, the abominants kids I've got, that go around thinking it is funny to eat people, and to pull them into their mouths, and crush them in miserable pain and agony, like my elephants abominants kids do to relatively normal human beings kids of mine.

Fisting And Punching People With Your Clenched Hands And Crasping Or Clasped Knuckles

You all have been bad kids, all of my guppies, all of you who do not work for me and go around thinking, 'Oh, gee. Aren't I special.' My guppies are these minded people, who are arrogant, who talk back to their mama's and to their papa's, and to their relatives, and brothers and sisters, and to their friends in school, and to their teachers. Later in life, they become worse, and they talk back with their actions of being mean to each other. As my guppies grow older, and become older people, they start fisting others, and that means, punching people, hitting them with their clenched fists and hard knuckles, and hurting them when they pound on their face, or on their stomach, or on their body some where, and break bones, and tear muscles, and stretch ligaments with their pounding each other.

Phlooching Out And Fisting The Vaginal Cavity, Rectal Cavity, And Mouthal Cavity

Fisting is a word used by some people to mean, to insert your hand into the vagina of a woman, and gay people, homosexually driven people, fist each other in the butt hole, if either men or women, or in the vagina, if women. Some people find it interesting to fist each other in the mouth, by sticking their fist inside the mouth of a person, pretending it is a dick or a dildoe. You need to phlooch out the neck muscles, and billow them up, or poof them up and out, and that will help them to gently relax, and then become expandable or

stretchable, as when they relax, they will easily stretcth out, and there will be some give, or freedom of expandingness. The neck muscles then become easy to stretch and push on from the inside with out hurting the person. It then is easy to insert your fist into the throat, to massage the inside of the throat, and to use your hand, or fist, to tickle the igniters, and triggers that set off love buttons and bells, and whistles, that help women and men to erotem, orgasm, and phlumett.

Fisting by inserting your fist into the vagina of a woman, when it is relaxed, and after you've massaged if for many hours, and after it begins to billow out, or poof out, and then open wide, and then you can see inside of it, and from the entrance of the vagina, there is a clear gaping cavity, you can then insert your clenched fist hand into, to massage the inside of the vaginal cavity. Doing this is very nice, and is very exciting to do, to help women and girls to erotem, orgasm, and phlumett. You can phlooch out the butt hole, by massaging it, for several hours, and it will begin to poof out, and expand, and you'll see a nanny gate face on it, and that means, it will begin to look a little bit like a vulva, or the vagina of a woman or girl when at rest, or exposed between a woman's or girl's legs as she is sitting or relaxed with no panties on or with no or few clothes on and nothing covering her hips, pelvis, lower pelvis, pelvital ridge, crotch and groin, butt and butthole and lower back, there by exposing her butt and vagina. If you compare a vagina with a phlooched out butthole, you will see they resemble each other, slightly. There is no vaginal cleavage of course, around the butthole, but there is a slight resemblence between a phlooched out butt hole, and a vagina, or vulva, none the less.

The Vagina And Vulva Compared To The 'Nanny Gated' Butthole

What is the difference between a vagina and a vulva? They are more or less the same, but the vagina includes lots of parts, inside as well as out side. The vulva is outside, basically, only, as far as I understand and remember these things, now. When you massage a butthole, long enough, it will begin to look like a vulva, or vaginal face. That's called the nanny gate, or on the male, the male butthole vagina, as I've spoken about it, before. On the woman, it is the female butthole vagina, a double 'immitation vagina' for the real one, as I've mentioned. Men's and women's buttholes are the same, and they both look like 'immitation vaginas' as I've also mentioned, after you phlooch out the butt hole of either the female or of the male. Once you phlooch out the butthole of a man or of a woman, it will poof out, and expand, and the butthole entrance and cavity will become relaxed, and easy to insert your clenched fist into, to then push up your fist into the butthole cavity, and massage it, once the person has cleaned out the butt hole cavity and once it is clear and free from debris matter, or food matter, and rotting food particles, and fleshy foods, or hamburger meat and so on. Phlooching out the vaginal caivity takes a little longer, but with patience, you can phlooch it out, and then

fist, in this manner. If you phlooch out the butt hole, and rectal cavity, you can fist your male friends, and your female friends, and every one, once they have cleaned out their poop hole, and made it free from rotting debris, will enjoy mutual, and reciprocal, fisting. Fisting in this way, for sexaling, is alright. Fisting in the other way, for beating people up, is not nice, and you are given poor marks for your actions of nautyness, meaness, and cruelty towards others.

Over the long course of time, you all have been naughty at one time or another. I have many ways to fix you, and to retrain you, and to rehabilitate you, but you always go bad, and sour, again, as that is your main drive, or driving internal force in your lives.

The Importance Of Kindlyness And Teamwork

Why have all of my guppie kids all gone south, or in other words, gone down the road towards unkindlyness? Because, as I've explained, you forgot what the Love Of GOD is. My religion will help people to understand what the Love Of GOD is, and that will help keep them on the correct path of kindly actions towards others, and it will help them to understand and remember that teamwork to help my working, unionized kids to keep our universe healthy, strong, durile, standing up, stable, a safe and happy place to live, and a wonderful place to live, is very important.

Doing things that support my kids working efforts, will be rewarded, and doing things that detract from the harmony and syncopation of the metered pace of my kids who are working, and that slows them down, and that causes dischordance, will not be favorably rewarded, and you'll become a female schmuck, or a male schmuck over the length of time, as you live on in my universe. A schmuck is an unlikeable person. Sexaling is the most important thing there is for us to do, other than feeding ourselves correctly to keep us healthy, and excercising, and leading a balanced, well regulated life, listening to your mama and to your papa. My religion is based on sexaling, as sexaling is the most holy and pure activity we can participate in, or do by ourselves.

All the bullshit propaganda of the Lesbianists, that Jesus said this, and that Buddha said this, and that God will save you if you do this, and so forth, is pure balooney, bullshit, and made up nonsense. I, GOD, will not do any thing for any body, unless you help me and my children to make this universe, a more kindly, and a more wonderful and prosperous universe for all of us. If you do, I will have my kids, bless you with angle dusts as they daub them on your forehead, and then pour barrels of angel dusts over you, as they dump barrels full over your head and body, for your extra good work, sexaling, in syncopation, with my kids working rythyms, and in rythym with their syncopations, flux, and their phenomenal elegance.

Phenomenal Elegance

What is phenomenal elegance? It is their keeping harmony with each other as they work and keep every thing in order, in my universe for me, GOD.

You can not escape from this reality of your good actions and your bad actions being recorded, as my kids keep records on every one, and we make certain every one is rewarded for their good actions, and we make certain that every one recieves as close to what they deserve, to help balance things out, in accordance with their markups, for their bad actions. If they are bad, they will not meet nice people, and they will meet naughty people, and not so nice things may begin to happen between them. If they are good, and if they try to help my kids, as I've explained about, they will get rewarded, and they will slowly begin to break away from keeping company with bad people, and they will gradually ascend to higher rankings or status, and then they will begin to lead a better life, and they will begin to escape from meeting with bad people, and the good kids' lives will become blessed by my kids, as my kids begin to sprinkle angel dusts on the good kids, and daub the heads of the good kids with purifying energies, and then dump purifying energies all over the bodies of the good kids who listen to their mama's and papa's, and sexal with them, and as they sexal with their mama's and papa's, and sisters and brothers, relatives, neighbors, and others, the good kids help my kids keep this universe running smoothly, in harmony, in flux, perfectly meshed, and in perfect syncopation. Mama's, papa's, sisters, brothers, relatives, neighbors, and others, all get their heads blessed with angel dusts, purifying energies, for their good actions along with the good kids, you, I hope, of course, too.

Plurlbalescent / Plurablescent Nature Of Negative Punishments And Positive Rewards

This is very important for every body to understand. I have my working, unionized kids reward the good people, and I have my working, unionized kids keep records on every action of every one of you, and I have my kids make sure the bad kids, meet with what they deserve, or some thing close to it, which may not be too nice, most of the time, and I have my kids make sure that the good kids, all meet with what they deserve, or something close to it, and that is usually always something nice. It may sometimes not be something conspicuously nice, but it is nice, usually, or positive in nature, always. The bad kids will get rewarded by something that is negative in nature, always, usually, or plurlbalescent. What does plurlbalescent mean? It means, it might not be noticably negative, but it is still negative, in nature, in essence. This is a topic we can discuss, another time, or you can ask my kids for more information on it, when you go in and visit them, with your mama's and papa's, sisters and brothers, relatives, school teachers, principal, costodians, janitors, school workers, and others.

We have had too much chaos of late, and for quite some time, and it is now time to slow it, and bring it to a halt. We are going to produce

positive harmonic concordances that will assist my kids as they work, and that will help them to stay working in harmony with each other, with your fucking, sucking, eroteming, orgasming, your shooting out of purifying energies as you orgasm, and erotem, and with the increase of the oooohs, and aaaahs, you help to produce, with your practice of my religion.

We have to bring an end to the moronic violence of the Lesbianists. If that requires a lot of my children, making lots of babies, and lots of energies, and percussive forces, when you set off a fracturable rock bomb, then that is what it will take, as you blow Washington DC and the Baltimore metro area off its ocean ledge, and into the Atlantic, with that fracturable rock bomb, if it is big enough. Yes, there will be lots of painful, ouches, and screams, and so forth, but it is trite, compared to the violence these idiots have been perpetrating, over the long span of time that they have been in my universe.

We have been here for a very long time. It is nearly impossible to figure out how long, other than with mathmatical computations. Our brains will burn out, if we try to figure it out in our heads. It does not matter how long we have been here. It does matter what we do while we are here. You are not going any where else, and you are all staying in my universe, so you will all drop your pants, and your dresses, remove your shoes, socks, clothes, underwares, panty hosees, and panties, disrobe, and begin helping others to make lots of ooohs, and aaaahs, and lots of eroteming and orgasming energies. That will be the begining of your getting into line with the rest of us, here in my universe, my kids who work for me. As you eroto with each other, you'll get graded on your performance, and you'll get paid by my kids, once you join our country, as I've explained about, before.

Timed Persuasive Mosture

What is a timed persuasive mosture? It is just keeping every body in synch with each other, persuasively and accurately moving along, orderly, in an ordered fashion or manner, and with every body in rythm and syncopated with each other.

Mosture is a type of motus, or motion or fluidity of movement. The timed fluidity or fluidness of my kids working along in synch with each other, is critical to having every thing in my universe, standing up and sturdy, with every thing holding together, as it should be. Otherwise, if my kids and their work get out of synch, things can come crashing down, and things can come falling apart, and we do not want that.

This is a big universe, and we have a lot of people in it, my kids, and you wouldn't believe how many kids I have. Anyway, they all have to stay in syncopated, fluid motion, with their paces of life perfectly meshing with each other's paces of life, to accomplish their jobs and tasks, in an orderly, and in a fluid movement, harmoniously, and without delays.

The persuasiveness is accomplished with the help of your sexaling, and by your keeping pace, and synching your sexaling activities, and the movements involved in your sexaling activities, and by your spraying out your energies, as you erotem, orgasm, and phlumett. The persuasiveness is also accomplished by your keeping pace in unison with others while you are praying the syncopated phrase, Nam Myeo Ho Ren Ge Kyeo.

Every thing is timed, and so as you activiate, or carry out these activities of sexaling, eroteming, orgasming, phlumetting, as well as the movements involved in sexaling, and as you pray, your synching of your movements and sounds in time and in pace with the syncopated and metered metronome click, click, click, at the timed pace of one thirty seventh and one fifth, on the metronome, approximately, helps to persuasively move, or persuasively drive and push, every body about, and along, as they do their work for me, in their many syncopated paces of life, or life spins. I have many children working at different life spins, as I've mentioned before, and each group of them has a different pace of life, or time spin. Your activiating, as explained, helps drive them along, each at their own pace of life, or time spin, perfectly meshed with every other child of mine, also in his or her, and at his or her own particular time rate of speed, time spin, life spin, or, pace of life.

Every one and every thing must move along in perfect flux, or perfectly meshed with every body, and with every thing that is going on in my universe, on every possible level. There are many levels where activities are going on, and many people are working at different life spins. Every one, no matter what level they are on, and at no matter what life spin they are living at, must stay in flux, perfectly meshed and in perfect harmony, perfectly syncopated with every one, else.

You are rewarded for your helping to move my kids along, in perfect flux perfectly meshing with every one and with every thing that is going on in my universe, with your efforts at sexaling, and with your praying, as explained, earlier.

In our new society, which we will create, you will score earning points, and every thing you do, as you sexal, and so forth, and as you pray, is scored, and a record of your capabilities, or excellence, or lack of excellence, is kept. You are paid according to your work performance, as you sexal, activiate, pray, erotem, orgasm, and phlumett. Also, you are graded on how well you get along with others, and on how well you try to harmonize and then sexalate with others. You score earning points, accordingly, and you get paid, according to how well you perform.

Keeping Every Thing And Everybody In Harmony And In Synch

Explaining how this works, how praying, fucking, sucking, dicking and hugging, etc., helps keep every thing in synch and in harmony and how your efforts are rewarded, is a tiny bit more complicated than my

simple explanation, but that is it in a peanut shell.

For those Lesbianists hiding among you who do not wish to surrender, you Lesbianists will find we are not going to be acting kindly towards you. All of you Lesbianists, where ever you are in Washington DC, or hiding underground, or in Paris, or in Rome, Peking, and so forth, you will be dealt with harshly, as we need to put a stop to your activities, and a "maybe" is not acceptable in this case. We are not going to allow you to continue your chaotic, nonsensical, violent activities one moment longer, and we will blow you up flying high up into the sky, and off the ocean ledge down below you, in Washington DC, as we sink your Washington DC area into the ocean, along with all of Northern Virginia, and the ocean coastal area of Maryland and Baltimore, along with large parts of the states of Virginia and Maryland, out to West Virginia, as that area settles down into and below the waves of the Atlantic Ocean, after we bomb it with one or more of my fracturable rocks weapons for mass removal of Lesbianists from the face of the earth and from their hiding places under the surface of the earth. The Lesbianists in the Washington metro area and hiding under it, had all better surrender to my kids, or they will all get their pants and clothes blown off and shredded from their bodies, if they do not, as they are given a free ride out and up into the upper atmospheres of our planet, and then, beyond. All other Lesbianists had better surrender, too, or they risk getting a free ride out, as well.

Deep Sea Ocean Trench Off The East Coast Of The United States

There is a trench that extends south wards from Washington DC, some times reaching 25 miles out in some places, and in other places, it reaches out to eight hundred miles from the shore. In the north, it reaches out in some places, 85 miles out to one hundred and twenty five miles out, to three hundred and fifty five miles out, to eight hundred miles out in some places, in the south.

It is fifteen miles deep when you go out forty five miles off the coast from Washington DC and from the Chesapeak Bay. The ledge bottom is found about three and one half miles down, and the mouth of the opening continues for ten miles, approximately, downwardsly, on the western side of the trench. The It has a gaping mouth, and it opens up and lets ocean water inland, under the continent, eighty five miles down below Washinton DC, three to six to eight miles wide, from top to bottom, from the underside of the top of the mouth, the bottom of the ledge, to the bottom of the mouth. From under the nation's capital, to the south, it travels to over eight hundred and eighty five miles. To the north, it travels three hundred and thirty five miles, to six hundred and fifty miles, to about nine hundred and fifty nine miles, inland under the continent, depending on where you wish to locate the edge of it under the continent, northwardsly. It travels to the west, inland, three hundred and thirty five miles, to just over eight hundred miles, depending on where you find the edge of it. It travels

inland further westardsly, the further you travel north. It is slightly over one thousand and eight hundred miles from north to south, in total, as you'll discover, once you explode enough, and after you explode large enough fracturable rock bombs, over Northern Virginia, Maryland, Washington DC, Baltimore, covering the metro area vicinity.

The U.S. Navy, and the U.S. Coastguard know about the trench, or parts of it. They are not allowed to discuss it with anyone. No one is allowed out there, to research it as it is off limits to just about every one. Some navy personel of high rank, and coast guard personel of high rank, are allowed out to take soundings, every now and then, with their Lesbianists' staff members, and Lesbianists' personel in the Navy, and in the Coast Guard. The Soviets, at least, Boris Yeltzin, Vladmir Putin, Mikhael Gorbachev, and Zelda Gorbachev, know about it, and so do all the other Lesbianists. They can confirm it, if they wish to play ball with me, and if they wish to save their asses, after they decide to surrender to my children.

The Shelfs Systems And Trenches Systems

The shelf estends to under Lexington Kentucky, at about ten miles below it. It is five miles up under Chatanooga Kentucky. It is five miles below Washington D.C., in some areas. It is three miles below Baltimore Maryland, in some parts of the city. It is eight miles up below Pittsburg, Pennsylvania. It is fifty five miles up below, or under, West Chesterfield, New York. It comes up to eighteen to thirty miles below McLean Virgina. It is eighty eight miles below Norfolk, and the mouth, downwardsly, is five to ten to fifteen miles wide open, in a downwardsly direction. It some areas, it can be found below Ohio, and under Indiana. It crosses under the West of Kentucky, and into the south of Illinoise, five to ten, to thirty miles. It is a variegated trench system. It extends to Tennissee, parts of North Carolina, Mississippi, Alabama, Georgia, South Carolina, and to under parts of Northern and Western Florida, and is open out and into the Gulf of Mexico. The whole area of Eastern U.S.A., is sitting on an open shelf, trench system, and there is water passing below it, and out into the gulf, in several areas, over to eighty five miles west of Corpus Cristi, Glen Garden, population eight hundred and fifty, which south of Galveston, and north of Corpus Cristi, between the two cities. There is a mouth eigty five miles south of Tampa Bay, Florida, in the Gulf of Mexico. There are several openings or mouths to the underground fault line system, and deep sea ocean trench system, and shelfs systems, and water is passing from the Atlantic to the Gulf of Mexico. There is also a trench system in the north, under Niagra, that extends southwards, several hundred miles, and it has many branches to it, and it extends into this system of shelfs, trenches, and under continental water flows.

Side Bender Currents

What is a side bender? It is a current comeing out of the mouth of an opening, from under a continental shelf system, that allows waters to flow out. As the water flows out of the mouth, the outlet current of water, it flows very forcefully in an outwardsly direction, and it pushes the water out with great force, generally. If a submarine is traveling in the vicinity of a side bender, the submarine may get hit broadside, and that will often turn the submarine topsy turvy, and around facing the opposite direction it was traveling in, or another direction, not the one it was traveling in, most often. The crew will get swung about inside the submarine, and they will fly through the cabin, and pounce off the floor to the ceiling, and hit the ceiling, and then hit the sides of the corridor they were walking along in, and finally end up on the floor when the submarine rights itself, with its balast, and you'll get many sprained or stretched ligaments, and broken bones, arms, wrists, fingers, legs, knees, ankles, feet, toes, necks, backs, hips, spinal injuries, and other injuries. It can leave a crew of a submarine nearly one hundred percent, injured and in a ship's hospital, or a Navy or military hospital for recovery. Side benders are often called upwellings of currents by the Navy, but that is not generally the case as they are not upwellings, but they are side pushing currents, that come flowing out from under continental water flow openings, horizontally. There may be some upwards lift involved, if there is a reason, such as a mouth is angled at a slight sloping angle, as it releases the flowing waters out from its tube like cavity or hole.

Crew members and military passengers of Naval submarine vessels are generally told not to talk or discuss any thing about side benders with non Navy persons, and with persons unrelated to their ship or unrelated to their ships voyage, as the governments of the world, do not want any one to find out about side benders, and they do not want people, geologists, marine geologists, undersea deep sea ocean studies researchers, or others, to research and investigate side benders. It's a big secret, these side benders, and that's what the marines, and the navy personel are sworn to keep, or face a fireing squad, on insubordination, or on some trumped up charge of spreading naval secrets, acting as a foreign spy and receiving money, or something like that. Naval personel will generally obey orders, and not discuss side benders, or other 'secret' information, with any one, as they risk losing their job, and they might face a fireing squad, or a hanging patrol, sometimes called a marching platoon, or a hanging platoon, a group of soldiers commissioned to carry out orders to hang some one who is in the military. If you pay a naval officer or enlisted person, or other person with Naval submarine duty, such as some marines, and others, enough money, they may be willing to share some information on side benders, and information about what they know about side benders. Some persons who have had Naval submarine duty, may genuinely not know any thing, such as crew members who are never assigned to submarines that travel near side benders, on a regular basis. Some times family members of enlisted persons and of Naval officers, are allowed to travel on submarines, for fun and excitement,

as a special reward for their papa's or mama's duty on a submarine. Some of these family members have also had some experience with side benders, such as those who have traveled on submarines along the Marianna's trench, or other trenches, not listed, neccessarily on global maps, but none the less, which are there, and that are near shelfs systems under sunken continental shelfs, or under sunken continents, but that eject streams of water, nonetheless.

Our maps and globes of the world are incorrect, the ones we buy through bookstores, or from map publishers, as nothing that would indicate sunken continents, large sunken islands, and related trenches, or other related features, are not going to be indicated on them. The Lesbianists do not want you to find out information that could provoke you into researching, under water features, that they do not want you to know about, as your fictious understanding they have taught you, of the surface of this planet, and its history, is bogus, and any thing that would conflict with that, is certainly not going to be indicated on a map they would publish, and the map will be wiped clean of all traces of any thing that conflicts with the 'global' history of the earth, as the Lesbianists teach it, in geology courses for high school students, and below, and above. The global geological history they teach must coincide with their fictious propaganda about Adam and Eve, and "Lucy" the ape woman, the supposed mother of all people living on this planet, and about this earth being only 9 billion years old, or thereabouts, which is a bold faced lie, and other such bullshit notions they have fed every one to swallow, and have forced them to accept, and that they force people to use as primal notions to base scientific research on. The geology of our planet is much more complex than the Lesbianists are letting on to, and there is much to learn about planetary geology, as these planets have been around a very long time, and many things have happened, over and over again to them, and many things have happened to our 'solar systems', and star formations, and star systems, that people need to know more about, to get a realisitic understanding of our universe, its history, and its many complexities. In time, we will learn much more about all these things, and you can attend courses that my children have set up for every one, to teach people about our universe. You need a day pass to visit, as I've explained about, before, and then you should swear in, and become a citizen of our country. We have yet to declare this planet ours, but in time, we will, once we have finished and put an end to the problems associated with the Lesbianists, all of their shenanigans, and their malarkying around. One day we will declare this planet ours, and my kids will take charge of everything, and they will appoint people to posts of duty, and to positions of responsibilities.

Making A Large Swimming Pool

People should begin moving off and out of the area, around the Nation's capital, Virginia, Maryland, Pennsylvania, West Virginia, and North Carolina. We'll have a big swimming pool there, with lots of,

mostly uninhabited, tiny islets, or hill tops and mountain tops, after all of the current residents die, and pass on and transel over to my Epcot Center, after one of our compatriots, or groups of them, detonate enough of my fracturable rock bombs. People will have to watch out for hungry sharks, after they swim inland, above the sunken landscape, looking for corpses to eat, and to scavenge, as lots of Lesbianists' corpses will come floating up from underground hangouts and cities of the Lesbianists, under those parts of the U.S., and from under the Gulf of Mexico, from under the sea floors of the Atlantic, from under the Niagra trench systems, and from under other trench systems in the Eastern U.S. This is not a joke, by the way.

Stagnasis

Salts kiddies in stagnasis is when the salts kiddies are in their salts kiddies crystals cages, in a hibernative state, in perfect equilibrium, to keep them alive and well, for as long as possible. Salts kiddies crystals cages sciences help you to understand many things about how things work in nature. Please read over my notes on my bulletin board.

Black Powder 'String' Fuses

Take a spool of sewing thread, and use Elmer's glue to coat the string, and run the string with a thin layer of Elmer's glue coated on it, through a bucket of black powder gun powder, which you can order in the mail, over the internet, or pick up at an antique musket or old style 'cap and ball' musket rifles and pistols retail stores.

Elmer's glue and gunpowder will combine to form a minor plastiques explosive, after the salts kiddies mix it up, eat each other up, pee and poop out lots of stuff that is highly explosive, as they get busy making babies, except when gunpowder is used in large quantities with Elmer's glue, to form a major plastiques explosive. Benzine will help this along, with diesel fuels, as well, and with chlorine, we can see some major plastiques explosives in the making, as mama's and papa's begin making lots of children, as they begin mixing it up, and as they all begin pooping and peeing out body fluids that is food for others, that will contribute to the powerfulness and explosiveness of the mixture.

After you make your string fuse, and let it dry out for a couple of weeks, then coat a rag or muslim cloth in oil, or grease, or a mixture of turpentine, gasoline, diesel fuel, and grease, with benzine, and make a paste, and use that paste to coat a thin cloth, such as a muslim cloth, and then let that set and dry for a few days, and then wrap a few sets of 'string fuses' together in a bundle, and place them inside the cloth. It will become a very powerful explosive, in itself, the more gun powder you use with it.

Test it, to see how fast it burns once it is wrapped in a cloth coated with a mixture of grease and fuels. The thicker the grease, the slower

it will burn. The thinner the grease mixture, by adding more turpentine, or benzine, or paint thinner, the more rapidly the fuse will burn. You will have a very powerful explosives cocktail, with this mixture, so be careful. You have to be very careful with what you combine, as you'll be bringing together very explosive elements, when you mix these fuels and liquids together with gun powder on a string.

A few string fuses, wrapped in a well soaked cloth, with a mixture of these liquids and the axel grease, will make a type of plastique explosive, that can be used as a shape charge, or a mouldable, or shapeable, explosive, that is good for blowing doors off hinges, such as at pharmacies, or banks, and for blowing locks on private homes' fences to pieces, such as can be found at the White House, at 1600 Pennsylvania Ave. Washington, D.C., at the entrances and exits gates of the White House where guards are on constant duty patroling the area for security purposes. An initial explosive, a detonated fracturable rocks bomb, small in size, may cause a concusive force to cause the guards to black out, and pass out, and then sleep for a while. Be very careful with the size of the bomb, as we do not want to level the homes and buildings surrounding the White House, or across from it in Layfayette Park. After you put them to sleep, with your initial blast, you can test the shape charge on the nearby fences, at the White House.

Black Powder 'Cap And Ball' Pistols

Most black powder cap and ball pistols and rifles, muskets, sellers and retail outlets can be found on the internet, and some gun shops carry black powder, as well as the detonating fireing caps, for black powder rifles, and pistols. Many of them do, and you can purchase the black powder and copper detonating, ignition caps, for useing in your cap and ball pistol, or musket, or other, more modern, hunting rifle, that allows you to use black powder, and detonating copper caps that slip on a small round fireing ignition nipple that is made out of steel, and has a hole in it, to allow the percussive explosives in the firing copper igniting cap to ignite on impact with the hammer on the weapon, when it slams down on it, and the flames from the igniting explosives mixture, glued to the inside of the firing copper cap, then ignite the black powder, that was rammed down the barrel, or packed and tamped down in a cylinder of a percusive black powder cap and ball pistol. The caps are fairly useless, unless you wish to add them to a fuel oils, chlorine formula, and let them sit in the fuel oils mixture, and that will help develop plastique, as well.

Higher Temperatures Develop More Useful Energies For Making Babies

The copper in the cap will also allow for a higher temperature in burning, when the fuels mixture ferments after a few weeks. Magnesium in the cap as well, will also help to raise the burning temperature of the fuels mixture, and with some black powder added, and with some chlorine added, your plastiques recipe will become even more useful. These higher temperatures will help to produce energies that will be

conducive to baby making among the fracturable, or rupturable, and percussive, rocks radiological salts kiddies. You can then add a handful or more of powderized amethysts, or turquoise, that you can purchase in bulk, on Ebay, for some small bulk quantities, and also emeralds are useful, as they all have fracturable rocks kiddies embedded in them, and fast asleep, in stagnasis.

Zircon Diamonds, And Other "Radio Active" Gem Stones, Etc.

Zirconium is a mineral that they use for the fake diamonds they sell with the trade name, Zircon diamonds, or Zirconium diamonds. You can powderize them, and use them for a good amount of fracturable rocks explosives, large and fast family making, salts kiddies, for a 'nuclear' party, and a send off to the eastern coast of the United States, before it is blown off the coastal ledge it sits upon, and then sinks below the ocean waves, if you strike it hard enough, with one or more of my fracturable rocks babies making, "nuclear" salts kiddies bombs. You'll need a few handfuls of Zicon diamonds, powderized, to make a nice fracturable rocks, babies making bomb. You can mix turquoise, emeralds that are mined and sold in bulk quantities on Ebay, amethyst, and the other rocks that I've mentioned, along with powderized 'sand' from the beach. Argentina, and Venezuela, Baha, and Southern California are good places to collect useful sands, full of fracturable rocks, salts kiddies, that a geiger counter will detect, if it is a sensitive enough geiger counter.

Geiger Counters And Their Usefulness

They are not too hard to build, but you will have to look in your Popular Mechanics magazines, for the details on how to build a "geiger counter". Some mining stores, and mining outfitters stores, may be a useful places to order or purchase a geiger counter, if you are on a family budget. You might find one on the cheap, on Ebay, that is still useable.

There are some kits available, if you look hard enough, to use to build your own geiger counter. A mining outfitters store, in South America, or in Central America, or in Utah, or in Nevada, may be able to help you locate a kit, to put together, if you go in there, and pretend you want to go out and look for interesting rocks, and you need some information on where to look for interesting rocks, so go to a mining outfitters store, or to a rock hounding club, or rock hounding retail store, for looking at beautiful stones that rock collectors, or rock hounds, have found, and made available at the store. Usually the store owner will have his or her suppliers, on name cards, and you can get in touch with them to get more information on where to look for interesting rocks to test with your geiger counter, since you are facinated by radioactive elements in rocks, and you are interested in finding some, for a collection you wish to start.

You might want to pick up some primer books, on minerals and rocks, gems, and gemstones, from Amazon online, or from a local book store,

such as Barnes and Nobel book store, which has a few useful books on rocks, mineral rocks, gems, and gemstones, that you can find when you are out rock hounding. Desert Outfitters in Las Vegas, a miner's outfitters store, that also provides useful tools to rock collectors, such as rock hammers, and hand held pick hammers, for chipping away at rocks, to see what is under the surface of the rock, or under the peel of it, the outer layer, as well as terrain maps, and outfitting supplies, tents, and sleeping bags, and so forth, has these types of books, and lots of maps, and maybe they can help you find useful kits to purchase, to build yourself a geiger counter. They also sell geiger counters for about three hundred and fifty dollars or so. Sears used to sell Geiger Counters, and they still can order them for you, I think, through their catalogs. On Ebay, you can find many reasonably priced Geiger Counters. How well the geiger counters work, the ones people sell on Ebay, I can't say, so you'll have to talk with sellers, and see what they say about the geiger counters they are selling to others on Ebay, or read about them in old copies of popular mechanics, and in trade publications for the mining industry.

Novice And Amateur 'Rock Hounding' Rock Collectors Clubs

On Sahara, east of Las Vegas Boulevard, there is a rock shop, which is about two and one half, or so, blocks down from the intersection, on the north side of the street, and they have information, as well as lots of primer books, on rocks, and on geiger counters, and where you can find them. They are well connected to the local rock and gem, minerals and gems finding, or rock hounding clubs. You can meet their members, and go out with them, on excursions, as they know where to find just about anything.

There are similar clubs in every major city, and in lots of smaller cities. Mining towns of course have lots of mining outfitters stores, and they probably have geiger counters for sale, so you can use it to find some very nice, fracturable rocks, along coastlines, or in ancient dry lakes and seas, sediments filled, rock hounding areas.

Decontaminating Your Self With Ocean Salts

Acidic ocean salts in ocean water will help eat up the radiological kiddies that find their way into your bodies, and that make you feel ill. It might take several weeks for initial recovery, with you taking large amounts, several teaspoons or more, as much as you can handle, in your diet, every day, for up to three to eight years, to thirteen years, for severe contamination, and for full recovery. Other things, such as nutmeg, and oregano, in a salty tea brew, will also help you, and marijuana in the salty tea brew, will further help you. Berries can also be of great benefit for recovery from radiological salts kiddies contamination.

My kids have a recovery kit, that will help you recover from an overdose of radiological salts kiddies, after a major birthing event, and that kit will help you fully recover. You need to join our

country, and swear in, and become a citizen, to be given one of these kits to help you for your recovery. They can provide you with information, of various kinds, once you swear in. They have you swear in as full time citizens, now, except in special cases.

Ancient Dry Lakes

There are many ancient dry lakes, up north, in the colder areas, of Manitoba, and around the edges of wet lakes, you'll find areas that dried out, a long time ago, and you'll find interesting things in the sediments deposits under the surface soils of the earth, that have covered most areas, and that come in to our atmosphere, and then deposit themselves onto the surface of our planet, as they are blown in on the solar winds. A few feet of top soil may cover the dry lake areas, around the edges of these lakes, and the soils depths may reach to twelve feet, to fifty feet, to sixty or to eighty of more feet, in some areas.

Once you hit the sediments layers, around the edges of these lakes, outwards to eight to fifteen miles, to thirty miles or further, out to up to eight hundred miles, as in the case of Lake Erie, and that lakes region, the Great Lakes, that all use to be one large salt water sea, but is now, a fresh water set of lakes, you can begin looking for the radiological bullets of the previous catastrophes in my universe, that shot out radiological salts kiddies, into the sediments rocks of mineral stones, and sand. Gravels might contain some "radioactive" fracturable rocks, and you can tell which are the useful ones, with a geiger counter. There are still salt water lakes up in Manitoba, Lake Huron, and some others, that used to be part of Lake Erie, and all part of the Great Lakes, when they were a large, salt water sea, but which are now, no longer part of that lake region system of lakes, as fresh water now fills up the Great Lakes from under ground water systems of fresh water flows.

Hydrolific Pressures From Water Falls

Hydrolific pressures, from water falls, primarily, help to erode and carve out and build the under continent open areas of water flows, that flow under the continents, and that dump their waters by traveling underground, in culvers, and channels, and in trenches systems, and then flowing out and into the oceans, resulting in side benders currents and flows.

Underground Lakes

Hydraulisis is one type of water pressures. Hydrolific pressures are those pressures created by water beating down, steadily, as water falls from higher to lower places, creating underground holes, and large open underground cavities, and water holding vessels, aquafirs, and underground lakes in the underground rock layers. Lots of cities sit on top of such underground lakes, on the crust of the surface of the earth, or very near to them. The lakes are often ovular and

rounded in shape, from top to bottom. Many former water falls, are now low lying, and flat, and there is no water fall on the river, except for minor, cascades, such as found in the Grand Canyon Rift Valley down the Colorado River, and out into the Baha area.

Baha Mexico

Baha is a good place to go looking for interesting, "radio active", or radiological rocks, fracturable rocks with radiological salts kiddies sleeping soundly, embedded into other rocks, after colliding with them, in a hail of radiological rocks bullets, after a planet or a galaxy, or a large nebular star system, or a cluster of them, were detonated, by some fool with a huge and powerful, home made bomb. This happened, often, in the past, and still, today, it happens, now and then. Bits and pieces of the radiological rocks will come flying in, and then embed themselves into other rocks, as I've explained about, before. We've had so many catastrophes in my universe, that our ancient rocks, are peppered with radiological rocks that are embedded in them. Off the coast of Baha, is a good place to go diving, looking for rocks that were washed off shore, as waters flowed down the Colorado River, trinities of aeons ago, when this planet was still a young planet, maybe about one fifth the way through its infancy, after reforming, again, after its last major impact that shattered it to pieces, for the umpteenth kazillionth, plus more, time. This shattering and reforming, has been going on too long to count, and obviously, there is a large amount of mixturing going on, with debris from other star systems, galaxies, nebulas, and so forth, floating in, and becomeing part of our planets, all around and about, on solar winds. You'll find rocks on the inside of the Baha coast, and on the outside, as well, and along the Baha coasts. You might have to dig down thirty of fifty feet, to a few hundred feet to find them, maybe eight hundred feet, or sixteen hundred feet, or further, but you'll eventually find something useful with lots of radological bullets embedded in the rocks.

Finding Good Rocks With 'Radiological' Salts Kiddies Bullets

You can find interesting rocks, also on high hilltops, such as in the Andes, the Himalaya's, the Swiss Alps, high mountains in Austria, and in Germany, high hill tops and mountains in Iran, maybe in Afganistan, and the very high hill tops, that are generally old hills, in many countries. They will usually have, if they are very old hill tops, lots of rocks scattered about that are very old, and that have lots of fracturable 'radiological' salts kiddies 'bullets', from previous detonations around my universe, and other related kiddies in them, as well. You can also find them along ancient river beds, and along dried up desert gulley washes, in the valleys between the mountains, in areas where tall, old mountains exist. You might have to dig down into the underlying layers of rocks to find really ancient rocks loaded and peppered with ballistic radiological 'bullets', tiny fragments of radiological materials that went shooting out upon detonation of

nuclear materials, elsewhere in my universe. Lava or basalt rocks, may also contain large numbers of radiological salts kiddies, and other types of kiddies related to radiological salts kiddies. Iron stone is a basalt rock, granites are also, and samples of them may be loaded with radiological salts kiddies, etc. Geiger counters will let you know if your sample rock material is pacted full and loaded with the tiny radiological 'bullets', or just partially loaded with them, depending on the response from the geiger counter. Many types of radiological materials, the bullets fragments, may not register on current day geiger counters, as they are not set to the correct radiological energies frequencies and currents settings to be able to detect them in the rocks. There are many types of radiological rocks in my universe, and current day geiger counters are set to pick up the currents and frequencies of the energies from only a few types of them, and there are thousands of types of radiological materials, so the older the rocks that you find, the more likely that the loads of radiological materials in them will be high in not only the types of radiological materials the geiger counter can detect, but also, in the types of radiological materials the geiger counters are not set to the frequencies and energies currents of. Such samples of rocks materials with large amounts of fracturable rocks, radiological 'bullets' inside of them, will yield massive explosive potentials, if you raise the heats energies of your explosives formula, to near solar temperatures, as I've mentioned about.

Plastiques, Explosives, Radiological 'Bullets', 'Nuclear Detonations', And Decontaminating Yourself Of Radiological Salts Kiddies

Please see my web pages for information on making plastique, along with metals fragments, and high temperature burnoff minerals mixtures explosives to produce the energies needed to produce nuclear detonations. Field chemists and explosives experts should be consulted, as they will probably know more about the temperatures at which different metals and minerals burn at and they will be more helpful in providing you with accurate information on different alloys mixtures, and the temperatures they burn at, such as the new US Mint US dollar coins, that will burn at extremely high temperatures, at about one fifth to one third the temperatures of solar temperatures, when ground into fine dusts fragments, and then after fermenting them, and then mixing the fermented particles in with the petrol fuels, chlorine, and gun powder, etc., plastiques explosives formulas, as I've explained about, to some extent, in my notes on my Gurkian Age Gurkian Way bulletin board. Be very careful when testing, as you may find the results extremely hazardous. See my kids, for more information, as I've explained about, on my bulletin board. Ocean salt will help to decontaminate you of radiological salts kiddies. A two hundred pound man will need about three pounds of ocean salt on a daily basis, to live healthfully. To decontaminate yourself, you will need more than that, to properly get rid of the radiological salts kiddies in your bodies, after you've been working with radiological salts kiddies, and testing the explosives potentials, for some time.

See my bulletin board for more information on the 'salts kiddies sciences' to help you to understand what is going on in so called, 'nuclear detonations'.

Sledgehammering Continents And Land Areas Where Lesbianists Live, Hiding Below

Here are a few places to place some other fracturable rocks bombs on, to make them fall in, and collapse down onto the layers of rocks, below, and then puncture the ceilings of the cavernous cities the Lesbianists have made, down below those lower rocks layers. Topango in the South Pacific near the Marianas, the area midway between the Ryukyu Islands and Haha Jima, Chichi Jima, and Iwo Jima, where you will find a sunken continent, Wellington New Zealand, Peking, Falklands, Urals Mountains, Chile thirty miles north of Concepcion and eighty miles east of it, near the Argentina border, and the Kamchatka pennisula, which will split and collapse in the center of it, midway down the penninsula, if you hit it hard enough. Lesbianists will come floating up, if their bodies can fit between the tons of debris that will fall in on them, as you smash the land sites that sit on top of ocean shelfs, and on open lakes below the land, some miles down from the surface, in some cases, and further down, in other cases.

It may be hard or impossible to deliver a nice bomb below the ocean above or onto the top of the sunken continent below the ocean, between the Ryukyu Islands, or Okinawa, and the islands of Japan, called, Chichi Jima, Haha Jima, and Iwo Jima. If one can be delivered there, you'll crush the continent below the surface of the ocean, and that will cave in on the cities, there are more than one there, that are below the protected shelf layer of rocks, above the cities the Lesbianists have there, below the sunken continent, to live comfortably in. The other places aren't so hard to hit. It is just a matter of local interest, and urging of the people there, to take the correct action to help us to resolve this problem, of Lesbianists living below us, all around the globe, in their honey comb, bee hive like canival of cities.

A canival of cities, is a large collection of cities that is located in such a way as to make it easy to get from one place to another. They are conveneint for them to live in as they are well placed, and spread out evenly, using the full extent of the area, as efficiently as possible. The Lesbianists have a canival of cities under the lower rock shelf layers, that are above them, and that help to keep them protected, warm, dry for the most part, but not always, and that are conveniety located each one in a bee hive like, configuration, well placed, with a well designed, layout, with central cities, and with satelite cities. It is well designed and resembles in part, Melbourne Australia, which was laid out, planned and designed as a modern city. The Lesbianists of course, think Melbourne is puny compared to their accomplishments, and of course, with the technologies they had and have available to them, from time to time, they made good use of every

inch of space they have available to them, under the lower hard rock, but leaky rock layers above them.

My kids have places and locations maps of all the best places to locate your home built fracturable rock bombs, and so please pick up the information from them, after you have sworn in, as citizens of our country. Also, please see my earlier notes on the sciences that support a correct understanding of radiological particals based fracturable rocks explosives and other helpful and useful explosives you'll need to set off the fracturable, also called, rupturable rocks bombs, i.e., the so called 'nuclear' detonations.

Topsoils

Did you know that nearly 99.9999+ percent of the earth's crust, or mantle, is formed from space debris that has floated in on the solar winds? It's true. Only about 0.000001 percent of the top soil is from local vegetation, globally speaking. The rest of the top soil comes in from above, blown in on the solar winds, as debris from other planets that have been destroyed, crushed, or blown to pieces by idiots with very large bombs, that demolished whole galaxies, or multiples of galaxies, in a few milliseconds, as the instant they blew up, they were so well made, or constructed, and so powerful, they instantly blew up the whole area of galaxies the planet was located amongst.

If for instance, you fill up one third of the large tourist attraction, the meteor crater in Arizona, with one of these fuels and rocks bombs, and ignite it, you'll disentegrate all of the Milky Way, and some what more than that, in one attempt, by my estimation, if the fracturable rocks bombs were made well enough with the fuels bombs, to burn at near or close to, solar temperatures, and if there were enough materials in the fracturable rocks, to get lots of mama's and papa's making lots of babies, relatives, and others. There are lots of different types of salts kiddies in fracturable rocks, and there are other types of kiddies, the radiological kiddies, which are sometimes, but maybe are not always, grouped with the fracturable rocks kiddies. There are many types of kiddies living in radiological rocks. When we send high heats waves energies, and other types of energies into the fracturable rocks, we can get many types of kiddies to begin making babies. If we get enough of the different types of kiddies to begin making babies, we will have one fine and dandy, explosive shower of baby making events. You can get further information on this topic from my kids, and if you tell your friends to check in with my kids, and to swear in, and become citizens of my and my kids' new country, along with other people who are swearing in, and becomeing citizens of our new country, my kids will make certain that every one is protected, and no one is caught outside, when the bombs go off, as my kids will tractor you and all the other citizens in, with my kids advanced teletransportation technologies, before any one can get hurt by the bomb or bombs blowing up, locally, or in their areas. That means, my worker unionized kids are very quick on getting people into the

encapsulated living environment every one is living in, below the ground, that my kids built for every one to live in, until we get this problem straightened out, and until it is safely over with. People can continue to live in the encapsulated living environment, after it is over, as we are going to start a new economic and social system, and we are getting started, down below, where my kids are keeping the encapsulated living environment, well taken care of and well managed.

Later on, we'll worry about who comes out, and when, as we have plans for every one, to begin working inside the encapsulated living environment, which is very well designed, and bomb proof, of course. Once every one gets accustomed to the new way of living, in accordance with my religious principals, and in accordance with our new working and living programs, when people have saved up enough money, they can pool their money, and acquire a lease for land up above, on the surface, and then with more money, they can have nice places designed for them, and built for them, with your input and with your instructions. You will need to study designing homes, and layouts of homes, for large numbers of people, as you will be required to live in groups of people, as the old systems of living, one husband, one wife, and so forth, is out the window, and now we are going for group living, with many members to your groups. When you have got the maturity together to live in large groups, and to sexal with many people in large groups, then you will qualify, and then with lots of earned income, pooled together, you and the members in your group, can then move up and live on the surface, in your well designed home, which my kids will use their technologies to build for you.

This is how we are going to clean up our planet, and get started with a whole new system for living and working with each other, as GOD's children working and living together, begining here, and spreading, slowly, across and throughout my universe, as we bring others into our program, all across the universe, from end to end, from top to bottom, and from side to side, and in every nook and cranny of my universe. All of my kids, you, who I am speaking to, will learn to live and work together, supporting my worker unionized kids, in our new global, united, and universal society, we will begin to build, on this planet, first, and then later, every where else. I am the mother and father of all of you, and of all of my worker, unionized kids, as well, all of my kids who work for me, of course, and of all of my living beings, and of all of my animals. We are going to get this big family of ours, together, and we, the human beings, will begin to clean up our universe, by sexaling for a living, and with many other living by the points systems programs, and other projects. We will also begin to get our heads on straight with religious activitiating, in other words, by participating in religialing, in groups, or by oneself, in the encapsulated living environment, first.

As we move along, in time, we will develop our working strengths, and character, and some people will qualify, eventually, for working in my religious brigade, once they realize and understand who I am, i.e.,

GOD. Others, who do not give a darn about what I am doing, may do as they like, as long as they are citizens of our country, and as long as they enjoy what they are doing, and as long as they add to the welfare of all people in our society, universal wide, as we build it, larger and larger, for all of my children, no matter who they are. We will one day have all of my children, working for me, and if they do not like working for me, they still have to pay the fees for the resources they use, just as I have to, and that means, there is a charge for every thing we use, and it is detucted from our pay checks. Every one gets a pay check, if they work, and if they are disabled, they will get earnings to support them, for as long as they need to be supported, until they are regroverated, healthy, fit, mentally prepared, and willing and able to participate. Those who do not wish to participate, will work in jail cells, and prison cells, sexaling for a living, with animals, as I've mentioned before, and at carnival and entertainment centers and districts, we will eventually set up, first on and also inside of this planet, in 'encapsulated' carnival and entertainment parks, and later on and within, other planets.

We are going to have all my children working for me, eventually, as I've spoken about before, and in time, most people will wish to work, and when they are mentally prepared to work, they will enjoy their working, most likely, as sexaling for a living, is not a unwholesome way to earn a living, and it is a pure and holy way to earn a living, and a pure and holy way to spend our time, as part of our new working ethics environement. For more information on this, please see my worker, unionized kids, who handle the information hot lines, in our, and your, and their, as well, encapsulated, living environement, which they have built, maintain, and manage, for all of you, and which they are continuing to build and expand on, for the rest of you, who have not checked in with them, yet. My worker, unionized kids have their own places to live, inside of the molecules that are used in building your living environment, and in your bodies, and in the molecules outside your living environement, as well. They live in all of the molecules, all over my universe, and they work in them, as well. They have their own universes, that they live in, which are all contained with in the molecules in my universe. It is a little more complicated than that, and so see them for more information on it, if you are interested in learning more.

Disintegrating The Milky Way

The Milky Way is made up of not one galaxy, but of several thousand, of different sizes. We don't have the technologies to see too clearly to distinguish the different galaxies that are within the borders of the Milky Way, nebular star system and nebular star cluster system, another way of saying that the Milky Way is a collection of many nebular star systems. Nebular star systems can be considered similar to galaxies, but maybe not always, as there are exceptions to every thing in most cases, any way. We are of course part of the Milky Way, I suppose you could say that, but we are far out on the outer fringes

of it, and we are not any where near the center of it, and we have our own galaxy we are a part of, and it is not part of the Milky Way, so technically, we are not part of the Milky Way, although we might like to think we are, since it is an expansive set of star systems, and star clusters, nebular systems, and other types of solar bodies systems, and it covers over us, and beyond us, sort of over layering us. Be that as it may, we do not want to blow up or disintegrate the Milky Way, as we are in a way, part of it, or at least, we are encovered by it. Encover means to be covered over by something and encased within it, or to be encircled or surrounded by it.

Lay Order Of People

I have no lay order of worshippers, who participate with me, in any thing, or in any way. Why? Because, that's like me, the captain of the ship, coming into a town of persons who I don't know, and then saying that I'm the authority over them. No one is going to listen to me, and no one should be expected to listen to me. I wouldn't attempt any such thing, and so as the captain of my ship, my religious order, I have no authority over lay persons. I have nothing to do with lay persons, what so ever. I will never have any thing to do with lay persons, unless they realize that I am GOD, and that I am the mother and father of all human beings, and all animals, and all living beings. No one is going to recognize me as GOD, for a long time, as no one has the karma to recognize and understand that I am GOD. Lay persons are free to do as they like, and I have no regulations concerning them, in my religious order. My children may have many regulations, for non religious order people, but I don't have any thing to do with that.

Donations For The Sake Of My Ministry

The only thing is, that, as I said before, if a person recognizes and understands that I am GOD, and that I am the Mother and Father of all human beings, all animals, and all living beings, then they are free to donate cookies to me, or clothes, or wearables, socks, and scarfs, or coats, sweaters, or slacks, neckties, and so forth, cakes, or cupcakes, baked items, or financial contributions, or chairs, and furniture, beds, linens, tables, office furniture, phones, phone lines wiring, electrical wiring, plumbing items, housing items, for building up a house, paved drive ways, mason or rock walls, surrounding the property, or a set of dormitories, or a prayer sexaling room, or a prayer ceremonialing room, or a swimming pool, sauna, bath house, toilet facilities, bathing facilities, laundering facilities, a root cellar, a molds and funguses workshop, a brewery workshop, or any workshop for helping to educate others, the land to build these things on, or money, or whatever. If some one recognizes and understands that I am GOD, then it is perfectly alright, to donate any types of items, or any thing of value, that would assist my ministry to get up and get running. As yet, no one has understands or recognizes me as GOD, and that I am GOD, and the mother and father of all human beings, all animals, and all living beings, so as yet, I have not heard from one person, not a letter, or a phone call, other than an occasional wise cracking person, mischief maker, or a person or persons who are

worried, and then complain to me, or rather, to my answering machine, typically, as I don't pick up the phone, now, as I had one person calling who was a bad kid of mine, and he was just looking for trouble, and since that, I just ignore all complaints, or wise crackers, or mischief makers, and so on.

Nollicking Foolish People

Some people do not like me wearing my GOd cap, that is one of those specialty base ball caps, but with 'GOd' written across the front of it, and they might hate me, especially some South American or Central American Hispanic types, who have primitive and backwards religions and filled with local lore and ancient tales of demons, and goblins, and gooney bears, or ghostly ghouls, or other superstitious ideas and notions of things that go 'boo!' in the night, and try to scare or hurt people, as there are plenty of folklorish tales of such things, in primitive cultures, that thrive, even at the current time, nowadays, in large cities, even, and these types of people might want to kill me, and when they knock on my door, with their gun in their pocket, or in their hand, machete or knife behind their back, I just ignore them, and I don't even bother to get up from my work bench, i.e., my bed, to see who is knocking at the door, as I know already, they have nothing to do with my monastic order, and because they have nothing to do with my religious ministry, or with my setting up my religious ministry.

Just last night, some group of people droped by, and banged on my door, with the tip or barrel of a weapon, and it was rather hard sounding, and I just ignored them, and after a few minutes, or so, they went away, and they haven't come back, yet. I don't think they will, and even if they do, I don't think it will amount to any thing, as I may have occaisonal visitors or harrasment calls, now and then, but that's all they are, and I just won't allow my self to be bothered by them as they are unimportant, and my goof ball kids, are just too nutty to figure out that I am GOD, and that they are my kids. Nevertheless, these goof ball kids are here or there, and I get lots of compliments about my hat, and usually, if not always, the person giving me the compliment wishes to steal the hat from me, and then rob me, in any other way, he or she can, and then beat me up, if he or she can. Well, I can't let these types of things get to me, and I just ignore them, as I walk by them, and I don't reply or return any statements to them, except a polite, 'thank you' if they gave me a compliment about my hat, but that's about all, and I might mutter something, like, and well, so that's just another one of my goof ball kids, or something to that effect.

Nollicking And Nollygaging

Nollicking means idiotic and foolish people who are wasting their time, for accomplishing nothing. It's like, nolly gaging, but nollygaging, is just wasting time, foolishly, and while you are nollygaging, you are looking for some way to make a profit, from your

use of your time. Scanderously, you try to extort money from others, or force others to give you money, you do not have any right to. That's nollygaging, as I can recall, at the moment.

Goof Ball Kids, Their Mischievousness, And Maliciousness

Well, I have all kinds of kids, and many of them are malicious, if you give them a chance, so I just stay away from all of them, as I know most every one of my children, is malicious, from time to time, if given the chance, and I think that applies to all of them, regardless of their age, at some point in their life, they will commit crimes of one kind of another, against others, and not think much about it, except that, they just had to take care of that, as they wouldn't be happy, if they hadn't. Okay, so every one of my kids, at one time or another, will do goofey or goof ball things, and not think much about it. That's the way it is. There is nothing to be surprised about, as every one, and I don't care who they are, every one, does things they shouldn't do.

Me, personally, I get angry, and say nasty things, and make myself sound gruff, now and then, and maybe I shouldn't, but I just feel compelled to do that, when I have a righteous conviction that some one deserves my speaking up and telling them off. Well, you feel sorry about it, afterwards, if you hurt some one's feelings, but then that's the way it goes, and no one is perfect, so it's just. Let's try to live and let live, and live together in peace, and cut out the naughtyness, and stop the mischiefness, if we at all possibly can, and apologise if the opportunity presents itself. That's always the best way to handle things. Most people, after they kill someone, can't appologise, and young girls and boys, and older girls and boys, think nothing of killing people, or having some one killed, for them, and then of course, there is no way for any one to appologise to the dead person, since that person is in my Epcot Center. Well, we can't do too much about that, can we, but we can try to be kinder, and not kill as much as we feel we must to be happy.

More Than Ninety Five (95) Percent Of The Homicides In The World, Some Times As High As Ninety Eight (98) Percent, Or Even Higher, Go Unreported, And Are Therefore, Not Investigated

It's too bad that we kill others, and torture others, but that's the way my goof ball kids live in my universe, and despite what people might wish to think, to the contrary, it happens every day, in every city, town, hamlet, county, district, or where ever. My goof ball kids are killing people, right and left, and there are just so many deaths, the police don't hear the ninety five (95) percent of them, or so, as they never learn about it. The percentage of homicides the police do not hear about, is perhaps just a little higher, but in any case, no one should be surprised, as that is how my goof ball kids get along with one and each other, and they have been getting along with one and each other, that way, for a very long time, already, so it will not stop, any time soon, and that's just the way things are, for now. The

Lesbianists are responisible for just about eighty five percent of those homicides.

Labrynthine Cities Below Us Where Lesbianists Live, And Laugh At All Of Us

The Lesbianists living below us, in their cavernous, labryinthine cities, that are below the hard rock layers, well below the oceans, and other bodies of water, far below the continents, go around, and mess with every one, and they play with people, and they think they have the right to amuse themselves by useing the citizens of this planet, any old way they like. They go around, and set up phoney wars, and they watch the citizens of each country, kill each other, on their commands. The Lesbianists enjoy playing these kinds of games, and they set up civilization after civilization, and they bring it along, and help to develop it, and when they get it to a high enough level, they feel a sense of accomplishment, and then they watch and amuse themselves as they destroy what they built up, and the people who are living, unawares of them. The Lesbianists think it is funny, that the Lesbianists feed the lies about our universe, and the lies about science, to every one, and the Lesbianists think they have the right to bafoonerize every person who comes into our world, as a tummy baby, who is on his or her way in, and in fifty to eighty or so years, is on his or her way out.

Why Do Continents Sink? Why Do Land Masses Rise?

Load transference technologies, and partical transference technologies, redistribute the loads on the internal network of underground cities the Lesbianists live in, to keep them perfectly centered, when ever there is a major uplifting, or down plunging, of continental mass, rocks, and earth, that would cause continents to sink and continents or land masses to rise. Movements of 'earthen matter' or rocks and dirt is accomplished with load transference technologies, and other technologies, such as partical dismissive technologies, and partical remissive technologies. This way, a planet can move, inwardsly, as a continent sinks, after the underlying rock layers are washed away due to hydrolific pressures, and not destroy the underground labrythine cities. My kids also use the same technologies, and other technologies, for maintaining the integrity of their underground encapsulated living environment.

The sinking of the continent pushes downwardsly, and as it falls, it exerts high intensity pressures on the underlying layers of rocks, stones, pebbles, sands, sediments, clays, metals, minerals, and so forth. The pressures will normally push downwardsly, and outwardsly, and shifting of materials, occurs, and land masses rise, as a result. When you have an underground city, or collection of them ringing the planet, when the pressures occur, and when the materials begin to shift, you redistribute the materials, using advanced sophisticated technologies, that will shift the particals in the directions they need to move, and distribute them so that they will not interfere with

the structural integrity of the undergound labrynthine, and perfectly, geometricly laid out city dwellings and living habitats. It's high tech stuff, and so if you don't understand how partical dismissive technologies work, or if you do not understand how partical remissive technologies work, you will have a hard time understanding how this is accomplished. There are other technologies, that also must be employed, to work in an integrated manner with the partical dismissive and partical remissive technologies. All of these technologies, working in an integrated manner, will perfectly redistribute all the particals of rocks, and so forth, that need to be redistributed. The technologies keep the ring of cities perfectly centered within the earth. If there is a need for downsizing of the interconnected labrinthine layout of cities, that is also accomplished with these technologies. Downsizing may occur for any number of reasons. I've briefly explained what can happen as comets and asteroids pass by our planet, at amazing speeds, and that we can lose some or part of our planet, mountains, terrain, and lakes full of water, with a pass by, by a solartoid, or planetary sun, as it wizzes by at a phenomenal speed. Once the planet restabilizes, the downsizeing process begins. Even though there may be continental shifts, of uprising and down plunging events, and large, cometary passbys, with the technologies that are available to the Lesbianists to use, on a 'for lease' option, the integrity of the underground labrynthine layout of cities, is kept in tact, as best as possible. The technologies that accomplish this for the Lesbianists, that keep their cities perfectly situated, are not on lease, any more, and they have lost their lease on the technologies that would allow them to keep their cities perfectly protected, and perfectly centered. Some areas may not be too livable, for them, as leaky ceilings cause waters to accumulate, below, and they must trudge through salty ocean water, knee deep, in places, and in other places, the water is too deep to allow them safe passage down one tube, or trammel system transportation pass through tube, to a city or to cities which were previously accessable.

The Leases On Their Technologies Are Expiring

The leases on the technologies that they have been using, and that were assigned to them, after they swore in, and pledged to live on this planet, and pledged to sexal for a living have been expiring for some time, already, and will continue to expire for some time, to come. Because this was a newly formed planet, before they arrived, but after it recongealed, after it was shattered to pieces by a passing cometoid that ran smack into it, as I've explained about, or touched on, a couple of times, before, see my notes on the web, once the planet stabilized, and became a livable planet, they first needed to live underground, where they could live, and slowly over time, adjust to the types of solar radiations, and other factors that they would need to adjust to to be able to one day come out from down underneath the surface of the planet and begin to live above ground. The rock layers, land, and bodies of water above shielded them from potentially harmful radiation. The living area below, also had built in protection

systems to help protect them from the radiative energies that could harm them. After they adjusted to the conditions of the planet, they could come out, and as they continued to sexal for a living, other technologies would allow them to build large cities, for them to habitate in, as they continued in the sexaling for a living program. The cities that my kids built for them, that my kids have the permissions to use for these programs, are now down under the rock layers, all crumpled up, or they have passed into the molten core, and have been spewed out, as basaltic lava, as the Lesbianists did not hold to their pledge, and they broke the law, and the maintenance of their above ground cities, was terminated. With continental uplifitings, and downplungings occuring, over the long period of time, they lost their cities, and now they have only the underground, initial landing zone area, dwellings and habitats, that have down sized, some what, since their initial landing for occupation of this planet, in the sexaling for a living program. They broke all the rules, and they developed their own sham governments on this planet, and they went about, causing mayhem and destruction, every opportunity they got.

The leases that they signed on to, and that were assigned to them, that they had on the initial landing zone technologies, as well as all their other leases, that were assigned to them are now in the process of being cancelled. That means, that, their underground cities are being shut down, slowly over time, - thus the leaky roofs - and they will have to move out, and move to the surface, as the underground systems, begin to falter, shut down, and fail, one after another.

This happens to them, repeatedly, life after life, and the end result is they destroy them selves. The hideous, hungry animals they illegally brought from other planets will get lose, and then they will help to hurry the demise of their world civilization, which means, every one of the Lesbianists will die on this planet. After the Lesbianists destroy themselves, they will end up in my Epcot Center, and they will come back out as tummy babies, to tummy mommies and to tummy daddies, who have karma that matches up with theirs, and then they will repeat their old mistakes, again, and again.

As the usefulness of the Lesbianists' underground labrynthine cities declines, as leases expire on the technologies that were assigned to them, and as other leases, will also be expireing, over the next few years, to ten or twelve to fifteen years, to thirty eight years, to fifty nine to sixty to eight five years, and then finally, when the last of their leases expire, some time, not too long after that, up to two hundred to eight hundred years, or so, and then there are still a few that will remain active, until every one is expected to move out, within a few thousand years, eight to eleven thousand years, as they must be given time to build up their own new civilization on the surface of the planet, where they can all live, together, now that the facilities below will be totally closed off, and shut down, and no longer useable to them, as they will be locked out, and prohibited

from entering them. Once they are completely out, my kids will then remove all traces of the underground cities and underground facilities, so that there is no chance of any one ever useing them again. The Lesbianists will then begin living on the surface, full time.

Late Night Amusement Activities For The Lesbianists

Currently, as a regular sport or preoccupation, the Lesbianists go out regularly, at night on hunting parties, after exiting from below up through secret stairways, that lead up through police stations, and through fire departments, and through some military barracks, and through National Guard barracks, castles, buildings owned by royalty such as a king, or a queen, a monarch, dictator, despotic ruler, or by dukes, earls, princes', princesses', public buildings, government buildings, and through banks, hospitals, morgues, cemetary parks, schools, parochial schools, college campuses, college buildings, universities, university facilities, movie theaters, dance halls, auditoriums, disco-techs, sports stadiums, ball parks, parks, indigenous peoples' tribal reservations, port and harbor facilities, port authority landing zones, free trade zone districts, political districts such as Macau and Hong Kong, bordellos, brothels, drinking establishments, cocktail bars, lounges, late night restaurants, physical fitness centers that stay open 24 hours a day, YMCA's, YWCA's, Greyhound Bus stations, train and railway stations, air ports, national parks and forests, BLM lands, islands owned by Lesbianists, Riker's Island, Staton Island, Alcatraz, islands that have military forts' and bases that are active or semi active on them, private residences owned by Lesbianists, and through businesses owned by Lesbianists, through twenty four hour a day businesses owned by Lesbianists, Walmarts, K-Marts, 'Toy's 'R Us', Wendy's, Jack 'n The Box, McDonald's, In-'N-Out' hamburger chains, sushi restaraunts, late night restaraunts, hotels, motels, churches, mosques, synagogues, military bases, public and private museums, BINGO establishments, pachinko parlors, billiards halls, race tracks, gaming and gambling establishments, and many other Lesbianists' controlled facilities, buildings, and so forth, above ground, and they capture and abduct people, then bring them back into their underground lairs, and then the Lesbianists torture them, barbecue them, and then cannibalize them, for food, in their underground lairs. The Lesbianists enjoy torturing people, and eating them, and these abductions go on, regularly, all around the world, and the torturing, barbecuing, and eating of the above ground residents, below ground, goes on all around the world, beneath the surface of this planet.

There are over thirteen billion of them, and the number is even higher, still, as I did not have that number correct, either. It is higher than that, and that means there are a lot of hungry mouths to feed, in the future, after they lose their leases, unless they get a new civilization built, which they never do, as they do not like to work.

They will come out, at night, regularly, and abduct people, and then carry them into their underground lairs, and then cannibalize them. This will grow more and more busy, as they strive to remove every one they can from the surface of the planet. After they have removed enough people, they will begin to live on the surface in the homes, and cities that are there, already. There are too many Lesbianists to live comfortably on the surface of the planet, and they are too lazy to build their own civilization with homes, an economy, and so forth, so they will inevitably begin warring against each other, until there are only a few left, and then they will meet their end, when their exotic and deadly animals that they brought here for their personal amusement, strike at them, and kill them, for food.

The only way one can find a way out of this predicament, is for each one of you to join my country, swear in, and become a citizen. The Lesbianists in turn, must surrender. If they do not, at a certain point in the future, we will begin to dismend them, and sent them to my Epcot Center. When that will occur, I don't know, but it could be as far off as a few thousands of years from now, as we have to give them the time, and a chance to build a new civilization, with homes, and parks, etc., working together with the people who already live on the surface of the planet. We cannot cut short the allowance they must be given, in fairness - as the leases continue to expire, and the leases protect them, to some extent - to make efforts to mix with the people on the surface, and to come clean, and to tell it all, and to appologize, and then to work in peace and harmony with the people who currently live on the surface of the planet. They will have to share their knowledge of the sciences, and they will have to help to educate every one, and they will have to teach the people who are living on the surface, the sciences that will allow people to regroverate their amoebes, and other cells in their bodies, and to rejuvenate their bodies.

There is not much chance of that happening and of gaining their cooperation, so we will have to be on our guard, and we will have to look out for ourselves, and make sure none of us are abducted by them as they attempt to diminish the population living on the surface of the planet by reducing the numbers of normal people living on the surface of the planet, as the Lesbianists begin to get busier, abducting people, and eating them, one after another, to make room for them selves, on the surface of the planet.

Never the less, my kids are not allowed to act prematurely, and my kids are not allowed to begin dismending them, just to stop them from doing what they typically do, after they lose their leases. So, it will be several thousands of years, before this topic comes up for discussion, and action is taken. These are not normal circumstances, and so the dismending of these people, may begin some time after their final leases expire, if they present them selfs as a problem to the rest of us, living on the planet.

Our War On The Lesbianists Must Continue

This means, we have a few options, here, and the best option is to just get rid of them, and destroy their underground cities, and destroy the Lesbianists, world wide, before the Lesbianists get much more of a chance to abduct, torture, and cannabalize the citizens living on the surface of the planet. Thus, our war is now only begining, and we must continue to eliminate them, as they will only cause mayhem, and destruction, for those of us, living on the surface of the planet, as the Lesbianists abduct, and capture people, then torture and cannibalize them, in coordination with their Lesbianists friends, who run this planet. The Lesbianists' activities aimed at destroying the populations of the planet, is guaranteed to increase, as the years pass. That means, we must continue with our campaign to destroy the Lesbianists, and we must continue to work to bring an end to the control that they have, over every one on this planet. We can also concentrate on destroying the Lesbianists, underground, by dropping the home made 'radiological' explosives weapons down into the ocean depths, and down into the depths of the deeper lakes, onto the leaky ceilings below, where the Lesbianists are living, to crush them, and to drown them all. In the meantime, every one must join my country, and swear in, and become citizens of our new country, as I've explained about, before.

The Valderizing Lesbianists

The Lesbianists do not teach real science, or real geography, or real history, or real mathmatics, or real chemistry, or real anything, and they fool every one with their bogus religions that they either made up or corrupted, and valderized. Valderized means, they vandalized it, and sprayed grafitti all over it.

Well, that's the way the Lesbiansts get their kicks, and they are just a bunch of grown up children, valderizing every thing they can, and disrupting every thing, and every bodies' lives, just for their own amusement, and cruelish fun and games, such as feeding former Lesbianists to my abominant kids, who are need to be fed, and who are smart, and devious, and who destroy humans, and eat them up, and spit them out, and treat them terribly, while the Lesbianists watch on, in amusement, as they see people like Bill Gates, or Steve Irwin, and others, eaten up and then tortured, as I've mentioned about before. Valderize all they may, and be cruel all they may, we are all now finally finding out about their treacherous and horrid behavior, and now we are going to put a stop to it, permanently, and that means we will kill every one of them, and send them all to my Epcot Center, as I've explained about before.

Now we know we can cave in their cities, below the leaky hard rock layers, way down below, if we hit certain areas, hard enough, with a nice big hammer, such as one or more of my 'nuclear' bombs, the fracturable rocks kids bombs, with fuels oils, burning at extreme high temperatures, and with percussive shock forces, these, mixed together, will get my fracturable rocks kiddies, making lots of babies, and with a large enough fracturable rocks fuels chlorine, and metals that burn

at high temperatures, nearing solar temperatures, we will see some very explosive 'family making' adventures, among my fracturable rocks kiddies, and their radiological relatives and friends.

We know where to hit some of their locations, to drop a few miles of more of continental shelf down onto the tops of their ceilings that will then fracture their ceilings, and cause massive damage, as oceans of water fill up their labrynthine and very well laid out cities, below us.

Who Do We Kill, First?

Mr. George Bush, Jr., Mrs. Barbara Bush, Jr., Mr. George Bush, Sr., Mrs. Barbara Bush, Sr., Mr. Ronald Reagan, Mrs. Nancy Reagan, and lots of their friends, and nearly the whole crew of politicians in Washington DC, are all Lesbianists, and I want you to kill every one of them, and send them to my Epcot Center, and I want you to place the fracturable rocks bombs, in the right locations, and then drop a thick layer of continental shelf, down onto their ceilings, their ceiling that are below the water that is between us and them, and that is below our continental shelfs that we live on.

We can hear the water down below, if we have the right types of listening devices, and if you find the right places to place your fracturable rocks bombs over, then it may be easier to drop your continental shelf, down through the water, below you, and down further onto their ceilings, the hard rock layers below the water, that is below your continent, swirling about.

Now I want you all to study this, and find the right places to drop your continental shelfs, down through the water layers below you, and onto their ceilings, so as to smash their ceilings. I've given you some hints, already, as to where you can place the fracturable rocks bombs, and my kids also have given some people more information on that, and so we have lots of people, who are interested in solving this problem of the Lesbianists toying with you, one life of yours, after the next life of yours. It is time we brought their mischief, and non sense, and cruelty to a halt, and it is time we put on the brakes, and slammed down on the brakes real hard, and at the same time, slam down on the ceilings of the Lesbianists labrynthine cavities, below you, their cities that they have laid out in perfect symetrical, geometric shapes, like perfectly shaped, honey combed behives, with central cities, placed symetrically around the globe, in a perfect geometric layout, and with spokes or corridors reaching out symetrically, to other central cities, and to satelite cities, that they have well planned out, and have well laid out, perfectly, below you.

Hydrolific Pressures And The Labrynthine Cities Below Us

Because of the hydrolific pressures, they can never keep the ceilings, perfectly dry, and they are always in trouble, trying to fix leaks,

here, there, and every where. Now it won't take too much to bring the whole place down on them, flooding them like rats in a cage, below the water line, as a boat slowly sinks with a rats' cage on a table, with rats in it, slowly into and below the ocean waters.

The ones above, such as George Bush, Jr. the current president of the United States of America, and his wife, and his supposed family and relatives, and all his close Lesbianists' friends, should now all be killed, point blank, with your fracturable rocks bombs. I hope that is perfectly clear, and I hope you all understand what the situation is, and that it is an intolerable situation, and we are not going to allow them to toy with us, any longer, and we are not going to let them amuse themselves, any longer, and we are putting an end to their games, now.

DO YOU UNDERSTAND ME? I HOPE SO! AS A 'NO SIR!' WOULD BE UNACCEPTABLE.

Now that we know where we stand, we have nothing further to argue about, and so let's get to our tasks, as soon as we are ready, and prepared. Okay? Good.

Local Area Prayerful Collection Site

A collection site is where people gather to pray, and to sexal and to purify each other. It is not a site where people ask for offerings, or where people as for any thing else, involving money. It is a sexaling park, and a prayerful sexaling park. That is the meaning of collection site. A collection site is where people collect together, to sexal and purify themselves, and while they are at it, they make sexaling efforts to help to purify others, by shattering and showering out megawatts and tons of radiating, purifying energies.

We have a local area park, at the corner of West Tropicana Ave. and South Decature Blud., a local BLM piece of land, that some people like to camp out in, that I go out to, to bless, and to purify with my religious ceremonies, now and then. I claimed that area, and all other BLM lands that I could claim under Gurkian Law, and all other land on this planet, that I could also claim under Gurkian Law, such as other parks and forests managed by other government agencies, or private lands, supposedly owned by rich people, and lands around the world, that I have a right to claim, under Gurkian Law, and all that land, is now mine, under Gurkian Law, and I can use it in any way that I need to use it, regardless of what other people, think.

Aerobic Taichi Practice

I am busy, now and then, purifying that parcel of land, at the corner of West Tropicana Ave. and South Decature Blvd., with my religious ceremonies, that I conduct with my religious prayer hand signaling statements and with my use of my ability of arerobic Taichi, for religious ceremonies, as I seem to have recalled a lot of areobic Taichi, as well as some other forms of Taichi, that I knew, before, in previous lifetimes, but I am only interested in using it for practical

purposes of religious hand prayer signaling.

I'm very clumsy when it comes to aerobic Taichi, but any way, I enjoy it, and it is good excercise for me, and the more I practice, the better I get, but it will be zillions of years, before I get any where near good at it. I practice the arerobic Taichi while I make my religious hand prayer signaling statements.

I don't teach Aerobic Taichi. I only use it for my prayer ceremonies, when I am on my feet, and not on my back, mostly, even though, I do use a short version form of it, while lying on my back, or, while I am on my side, I use a very short form of it. Anyway, it is fun to do Aerobic Taichi, and that makes my prayer ceremonies, for me, more fun. When other people learn to prayer signal, they will naturally pick it up, as well, as every one has studied to some extent, Aerobic Taichi, and other forms of the martial arts, and my kids will release the knowledge that is stored in your memory banks, as you need it, once you begin practicing, for women, as a priestess, or for men, as a priest. It is not like the Taichi you see people doing in China, or Taiwan. It is a specialized form of aerrobic Taichi for use while performing hand prayer signaling. It is not used for fighting, but it is the basis for Taichi, and you can train in martial arts, while employed as either a priestess, or as a priest, and it will be useful to you to know, before hand, as it will make practicing your martial arts, that much more interesting.

I'm not hiring any one, now, or just yet, or any time, soon, as far as I know, as my kids do all the interviewing, and I have nothing to say, about who comes knocking at my door, to be interviewed.

Campers, Camping, Sexaling And Purifying The Area, And Useing The Parcel Of Land That I Publicly Claimed For My Setting Up Of My Ministry

Now, on that parcel of land, there may be campers, now and then, who want to camp there, because they want to find out more about my religion, and so they come out to Las Vegas, now and then, and they camp out there, on that parcel of land, at the corner of West Tropicana Ave. and South Decature Blvd. Since that land is where I am going to set up my initial ministry, when the time for that comes, I am preparing it, with my religious purification ceremonies, and there doesn't seem to be any troubles, with any one telling me not to go up to my property, that parcel of land, and there is no one trying to tell me that I can not bless my property, that parcel of land.

Now, if other people wish to come to that parcel of land, and wish to sexal on it, and thereby purify that parcel of land, they are more than welcome to come to it, with their camper trailer, or caravan bus, and they can maneuver into the area, and set up a tent, and campsite, but there is no water, or any thing else, so you have to come prepared to rough it, if you wish to come in your camper van, or caravan bus, or in a camper trailer, or with a tent, or with other types of

sleeping and living gear.

Straightening And Cleaning Up The Area

You can straigten up the area, and clean it up, and make it nice, for many people to pull into, to join together, and to sexal together, and with your purifying energies from your sexaling together, you are more than welcome to stay there, as long as you like, and as long as time permits, and as long as finances permit.

I have nothing there, except for my now and again, Aerobic Taichi practice and the energies that are imbued into the area, there, from my religious hand prayer signaling ceremonies. There are no structures of any kind, and I am sometimes there, busy purifying the area, with my religious ceremonies, so if you and your friends would wish to come to that area, and also help to purify it with your sexaling energies, than you are more than welcome to come and visit there.

Donating Your Sperm, Sexaling Spittle, Perspiration, Vaginal Juices, Titty Juices, And All Your Sexaling Juices

You men and boys may by all means, donate your sperm juices, sexaling spittle, and other sexaling juices, your perspiration you generate while you are sexaling, to the site, and you women and girls may by all means, donate your vaginal juices, your titty juices, your sexaling spittle, your perspiration you generate while you are sexaling, and all of your sexaling juices to the site, as they all will help to purify the property that I intend to set up my ministry on, as they all contain many, holy, pure, sacred, powerful cleansing energies, and GODLY energies in them, and they will help purify the land, and the environment for ages and aeons to come. All of your eroteming and orgasming energies will go shooting throughout your bodies, and they will find their way throughout your bodies, and out of your bodies and brains, and into the environment, and into your bodies' sacred and holy spillages, as I've discussed about before. Your bodies' spillages, as well as your perspiration, your pee, and your poop, not to mention all of your other juices that are produced as you sexal, erotem, orgasm, and phlumett, become pure, sacred, holy, powerfully cleansing, and GODLY, while you are sexaling, eroteming, orgasming, and phlumetting. Your pure, sacred, holy, powerfully cleansing, and GODLY energies find their way into all of your bodies' spillages, and so please donate them to the site, in appropriate manners.

Building A Latrine

Please employ some one to dig a latrine, and to fashion benches to sit on so as to be able to dump your poop, and pee your urine, into the latrine trenches. Manage the latrine, with care, and employ healthful, tactical, and sanitary techniques to use it safely. Provide hand rails, to grasp, so that no one will slip off and fall into the latrine. Provide barriers so that no one can accidentally fall into

the latrine. Use your common sense when providing 'tactical' safety measures.

You need not fashion an over hang, as there is no rain to speak of, in Nevada. You do not need a supported roof, or enclosure, as they will only become stench ridden, and no one will enjoy useing them. There are to be no enclosure walls, or sides, or backs, so as to enclose the odors of the latrine, and confine them to an air tight area, where they can accumulate, and cause explosions, accidentally. They need only be deposited into a safely dug, latrine, and then allowed to filter down into the soil, and then allowed to vapor up into the atmosphere, freely.

No doors should be used, and no barrier walls should be employed, when fashioning the outside framing of the latrine facility, itself. That means, there are no hiding places in the latrine, where people can hide, and be prevented from entering, or exiting from the latrine. Only hand rails need be supplied, and only barriers that are suitable for keeping people from falling into the latrine, need by provided.

Steps may also be provided, to a raised platform latrine, which is more sanitary to use, than a level to the ground, latrine. There should be no walls, and no blind spots when either ascending up the stairs or when descending down the stairs. Women, girls, men and boys, should all use the same facility, and there is to be no fraternizing. Fraternizing is playfully tearing up at the opposition, or at people who you do not like.

Tearing up at the opposition means, you are trying to over throw the person, and dispose of that person, into the latrine. Over throwing the person means to be using reckless abandonment when dealing with another. Reckless abandonment means to be recklessly risking the life and limb of another.

There will be no frolicking at the latrine site. Frolicking is when little boys, and big boys, and little girls and big girls, play around and provide possible hazzards to others. You will not behave in a hazzardous manner towards any one, at any time, or you will be asked to leave, and to not come back.

There will be no play time allowed for children, as this is a collection site, and that means it is a holy site for holy activities, so leave brats at home, and do not bring any one who drinks alchoholic beverages, or who acts unwholesomely, to the collection site. This is a private site, and a prayerful collection site, and that means, you are coming there, to pray, and to make love, and to sexal, as GOD's children, so as to purify the site. You are not allowed to act randomly and with reckless abandoment. Randomly means, without proper self control and restraint. This is not a gay fashion, show or parade, and we will not tolerate reclusive, or unwillingly unwholesome behavior.

Reclusive means, unwilling to participate for the stated purpose of purifying the area. Reclusive means, caution and carelessness is thrown out the window, and you are acting in an irresponsible manner.

Unwillingly unwholesome means, first, unwillingly means, non cooperative, private, or sordid. Sordid means you are acting in a selfish manner, and you are not acting in a responsible manner for self and for others.

Unwillingly unwholesome means, thusly, that you are acting in a selfish manner, irresponsible manner, uncaring towards others, and unwholesomely.

Unwholesome means, you do not care about the life and limb of others, and you would just as soon shoot a person you argue with, as talk to them for a friendly chat. Many of my kids, are very unwholesome, and will just as soon, talk to a person, as shoot the person. You will not act in any such manner.

Any unsafe or prohibited latrine construction will be ticketed on detection, by me, and you will be asked to rework the facility. That will be on the ticket, and please comply, if you and your friends who built it, will be so kind. If you do not rebuild it, you will be asked, with your friends, to leave the site, as you are acting in an irresponsible manner. You will not be allowed back to the site, without your showing proper repensive behavior. Proper prepensive behavior is an attitude of appology, as well as the acts of appology which means, you will take appropriate steps to see that the work is or has been redone, in the manner as required by safety laws, as stated by my children, under Gurkian Law. Either me, or my children, will leave the ticket, and you will be required to fix what ever it is you need to fix, or you will be asked to not stay and conspiriate at the collection site.

Conspiriate means, to participate freely with caution and care for the sake of others. Conspire is also the same, as conspiriate.

You will be asked to not stay and conspire at the collection site, means, the same thing. It means, you will not be permitted to participate freely with caution and care for the sake of others. That means, you will be asked to leave, and you will not be allowed to come back, if we, my children and I, and other attendents, as well, can at all help it.

Attendents are people who participate in the collection site activities, and they are people who take responsibility to make sure every thing is done, properly, and safely, with the sake and safety of others, in mind.

The Home Depot has many nice and useful janitorial equipments, and so it will not be difficult to build a safe and luxuriously clean, and handy, latrine, that is safe to use, for all people, of all ages.

Luxuriously clean, means, it is kept sanitary.

How do you keep a latrine, sanitary? You keep it clean and sanitary by venting the air out, freely, with no blind spots, either underneath or above, where pockets of air, and vapors can accumulate.

No partitions will be installed that will create a blind spot. A blind spot is an area where light can not penetrate. Therefore, your construction materials, must be perforated wood, or grated steel. You can weld together, if you know how to weld, a very nice, grated steel, latrine, that will be safe to use, by every one, of every age. You will need the correct strength of supportive steel poles, to handle the weights of the persons accessing the latrine, and of the latrine, as well. You will make certain to build it well, and to support it well, with firm foundations, of concrete or steel plates.

Any deviation from safe practices for building latrines, will be torn down, disassembled, and the persons or person responsible will ethier be asked to leave, or will be asked to appologise to the memebers of the collection, sincerely. If the person acts in a responsible manner, and appologizes, sincerely, and appropriately, then the person will be excused, with out further, charges being leveled. Further charges will be leveled by my children, if my children detect further, reckless abandonment on the part of any person, participating and acting in a reclusive or recklessly abandoned manner.

Glue People Begun 'Cleaning' Agents

Cleaning the toilet seats of the latrine, will also help to keep the latrine luxuriously clean, and sanitary. You should clean the toilet seats and parts of the latrine, with common household detergent agents, as at this time, we have no choice but to use the unwholesome, Lesbianists' manufactured, ajax, spic and span, lysol, and other such 'glue people begun' agents. Glue people begun agents means, aerosols, and other unwholesome petrol fueled compacted or pressurized sprays, or detergents, that help the Lesbianists to begin the process of turning human beings into glue people. Glue people, in this instance, does not refer to glue, but it refers to tar. Tar is an adhesive substance, and their intent was and is to turn every human they can find into tar people.

We have no choice but to use the local distributors selection of cleaning agents, but in time, we will one day, have all that straightened out, after we demolish the Lesbianists' hideouts, under ground, and after we kill them all, or welcome them in, as 'surrenders', with appropriate, remorseful, penentant attitudes.

Removal Of Latrine Wastes And Disposal Of Latrine Wastes

Latrine wastes materials shall be removed, and supplied to local pig farmers, who can then use the materials, for feeding the animals. Pigs and hogs love to eat away at latrine wastages, and no one knows that. Chicken also enjoy eating human wastages, as well as ducks, geese, and other fowl. Horses and burroughs also enjoy human wastages, if it is healthy enough, with large amounts of vegetable mass in the diets of

the human beings, whose wastages are carried to the farms for spreading about in the hogs and pigs, barrels. A barrel is a place where wastages are loaded, up into trucks for delivery to a sewage farm, or a place where farmers can use the wastages, that the hogs are finished with, as fertilizers.

Hogs and pigs use a roped off area, for eating wastages, and employees keep track of the unloaded wastages, and the spilled wastages from the hogs, and then the spilled wastages from the hogs, are then moved to a separate area, for pickup by carriers of farmers. Foods grown at farms using hogs and pigs wastages are useful and nourishing to humans, and other animals.

No fees of any kind for loading and for carrying away wastes to hog and or also pig farmers, should be levied by truck drivers, as drivers will earn a tokenous gratitude tip from the hog and or also, pig farmer. An appropriate payment to the driver and deliverer of the human wastes to the hog and or also pig farmer, should be paid by the hog or also pig farmer, unless the farmer is cash strapped. Cash strapped hog and pig farmers may be given money compliments by the people at the collection site.

Money compliments are small awards, or minor payments, out of gratitude to the hog and pig farmer, for his or her useage of the human wastes from the latrines. Money should be collected, regularly, if hog and pig farmers are cash strapped, and then given to the hog and pig farmer, out of gratitude to him or to her, and presented, tokenously, or as a gift payment. How much should be paid, depends on the expenditures of the driver, for his or her services, and for the use of his or her, vehicle, and for its whollyfied maintenance.

Whollyfied means, the regular maintenance that will allow the truck or vehicle to run at tip top conditon or shape, for the life of the vehicle, figuring it proratively.

Proratively means, spaced out, and paid proratively, or over the period, at regularly spaced points in time, over the given span or the useful life of the truck.

Discussions regarding this, and discussions for compensations, should be held at the collection site, and at the delivery site(s) for delivery of human wastes, by all parties, concerned, regarding all of this, and the primary collection site attendants, the persons elected by the attending or participating persons, at the collection site, who show the greatest interest and sense of responsibilities, at the collection site and with regards to the collection site, and with regards to the collection sites' safe, healthy, and wholesome management, must attend the discussions, and must deliver their sound judgements as to who is to be compensated payments for their participation in the removal and distribution of the wastes from the collection site, to the hogs and pig farmers, and as to how much should be dispensed, per each removal and delivery of human wastes.

Participating persons at the collection site, should elect attendants, and the attendants should regularly check on all points for the safe management of the collection site. Participating persons means, persons who are there for sexaling, and for depositing their holy, pure, sacred, powerfully cleansing, and GODLY sexaling juices at the collection site.

Nevada Power, and all other vendors, are not participating persons, and should not be construed as participating persons, regardless of what they might wish to think, and if they have any complaints, I authorise the killing of all persons who disagree, and persist in arguing that they are valid participants, despite their not participating in your holy sexaling, activities, as individuals, and not as company employees. No company employee, or personel of any kind, may participate, except as an individual, lone, and wholeseome, participating, sexaling agent.

A sexaling agent, is a person who is participating at the collection site to assist in the purifying of the parcel of land, on which I will build my ministry, with the assistance of my children, by their participating in sexaling activities, and by their depositing of their sexaling juices upon the grounds of the parcel of land.

How To Disperse Your Juices

Sexaling outdoors will normally require that persons are naked, and juices will naturally find their way to and into the ground. Men, boys, women, and girls, all must be naked, while sexaling outdoors, except for those persons who need to be on the move, such as male attendants, who will need to go around, periodically, checking on the points of interest, to maintain the soundness and integrity of the collection site, and of all things related to its operation and management.

Clothing

Clothes may be worn, at times while not sexaling, as particapating persons, decide.

Scarves, hats, and minor shawl like garments, Roman, Turkish, or Russian togas, or other comfortable sexaling apparel, for women and girls, to protect the dermal surfaces of the wearer of the scarve, hat, minor shawl, or other apparel, are allowed to be worn, while sexaling. We need every inch of dermal surface, bare and naked, if possible, or at least, accessible, to allow for maximum eroteming sensitivity, touching, massaging, tickling, and so forth, to heighten the erotic levels of excitement, and thrills, eroteming, orgasming, and phlumetting.

Men and boys may wear light weight garments, such as Roman, Turkish, or Russian togas, or other garments that do not interfere with access to sexaling buttholes, dicks, and so forth, for men and boys to be able to maximize their sexaling enjoyments, erotic attachments, their purposeful eroteming enjoyments, orgasming thrills, and pleasures.

Erotic Attachments

Erotic attachments refers to their titties, dicks, buttholes, mouthal holes, tounges, and other touch sensitive, eroticable and orgasmicable body parts.

Purposeful eroteming enjoyments means, their steady minded, determined, and sustained sense of attaining to the highest levels of eroteming enjoyments possible.

Leveling The Area

Some minor leveling of the area, for maximum use of the area, as an automobile and camper trailer, caravan bus, travel trailer, campsite park, will need to be done.

There are many tiny hills, and a few large ones. There is much dirt that can be removed, from the middle of the site, all the way back to the rear edge of the site.

There is a hilltop trailor park, past the edge of the rear of the parcel, and there will need to be built a very durable, and strong retaining wall, to keep that hillside, shored up, and to keep the trailor park from crashing down the hill side, after slide begins, and creep causes the trailor park to fall into the open area, that will be needed to be excavated, all the way to the rear of the park.

The grade or slope of the hill, need not be steep, but can be at a relatively low angle of ascent. An angle of between ten to twenty five, to thirty degrees, in graduations, from front to back, can be accomplished, with little difficulty, and with no disturbment to the trailor park, or disturbment to the integrity of the trailor park.

We need not seek any permits for construction, as I do not recognize the Lesbianists' governments, on this planet, and if any person shows up who says he or she is a county or city planner, inspector, or whatever, you are to immediately kill the person, and deliver three fivers to the persons' head, as that person is a Lesbianist attempting to interfere in my religious activities.

All activities at the site are to be done, without any interference from any public or other authority, and all costs for all changes and alterations to the site are to be financed by the local construction companies, who are working on the hotels industry, and they will cease immediately their work on all construction, private housing construction, casino construction, and all other towers construction, or work construction, other than the basic infrastructure needed to support the present population of Las Vegas, Nevada.

We are taking over this town and you all will begin to prepare to vacate this town and hand over all of your construction equipment, now, or face your companies and your private persons destruction with my fracturable rocks bombs, begining with the New Orleans Hotel, and all related hotels, and casions, bars, and restaraunts. That means,

every gambling establishment is to shut down, stop construction, and vacate this town, now, immediately, post haste, if you wish to live.

You will be destroyed if you refuse to follow orders. We are putting a stop to the non sense of the Lesbianists begining with Las Vegas, Nevada, Henderson, Pahrump, and all parts of Nevada and the Southwest.

You will disband your operations and hand over your companies, such as the water bureau, the power company, the gas utility company, and every other company, including all supermarkets, grocery stores, malls, and so forth, every last business in Nevada, and the south west, to the participants at the collecting site, to take over and then properly manage, until all residents of Las Vegas, remove themselves, to my kids facilities.

Is that understood? You are all resigning and moving into my kids place, underground, surrendering, and moving on for those who are not Lesbianists, but who wish to vacate this area, as this area is in whole, now, a religious grounds.

That means, that I will require the participants at the collection site to take over every thing, and to bring the news reporting stations to their knees, and force them to report the news, that every one is to retire to my kids underground, fortress, and they are all to remove them selves from Las Vegas, now, post haste, immediately, other wise, we will have a fractuable rock bombs throwing contest, to see who we destroy, first.

You must surrender all your holdings, owned property, equipments, and every thing else you call your own, and hand them over to the participants at the collection site.

Is that understood? "YES SIR!" had better be your answer, or you will find yourself on a one way ticket to my Epcot Center, with no return ticket, guaranteed, for however long it takes, to find you tummy mommies and tummy daddies.

I don't think there will be many volunteers, in the near future, as you are all abominant kids of mine, and the only kids people will ever bare, for some time to come, are abominant kids, and animals, and animal humans abominant kids, so I do not think you'll be leaveing my Epcot Center any time soon, if you resist and if you force us to kill you.

Is that understood every body? Good.

The penalty for not complying is death. Do you understand what I am saying? I hope so.

The Party Is Over In Las Vegas, And In The World

The party is now over, in Las Vegas, and at all casinos and gambling establishments, as we know you are all cheating, and we will kill every single last one of you to close you all down.

Who Is Staying And Who Is Leaving, Etc.

You will close down all of your establishments, world wide, and lock the doors on them, and then demolish them, post haste. Is that understood? I hope so. Either you do it, or we will do it. Do you understand that, now? I hope you do, because we are going to demolish every one of your establishments in this town, if you do not demolish them, yourselves. Every last one of them, all houseing, except for those noted in my children's compliance statements, which you are all to recieve, all trailor parks, with some exceptions, all every thing is to be removed, with only the basic infrastrastructure for heating, lighting, water, sewage, medical, hospitals, medical clinics, pharmacies, and so forth, food markets, services industry, HUD, Welfare, SSI, and other operations for the welfare of persons who are here, who can not leave, or who will be staying for some time, and who will be needing the services of those agences, construction companies, lighting companies, electric infrastructure installation and maintenance companies, as well as gasoline supply and distribution vendors, diesel fuels supply and distribution vendors, restaraunts, and telephone. That means, all humans are leaving, except for those person who are to stay on, as indicated in my childrens' compliance statements, and except for those who wish to stay on and participate in spilling their pure, holy, sacred, purifying juices, and those wishing to participate in purifying my area, all of Las Vegas, Nevada, the valley and beyond, in time.

Rules For Hospitals And Clinics, Etc.

There will be new rules for hospitals, and clinics, and my kids will see to it, that the new rules, are followed. There will be other rules, as well, and my kids will see to it, that they are followed, as well, or persons who wantonly disregard them, will end up in prison, underground. My kids have not only a living environment, they have prisons, as well, jail facilities, and many other things. Check with them for a fuller list, of what all they have in the way of facilities, as many are very nice, and there are great possibilities for improving your health, and rejuvenating your bodies, etc.

My kids have a full list of who is to be leaving, who is to be staying, and by when people are to be leaving, and where persons staying, are to be moving to, as we clean up this area.

All of you had better check with my kids, especially, you Lesbianists, but not only them, you religious fanatics, as well, and every one else, of course, or you, especially the Lesbianists and religious fanatics are at risk here, but not too much, the others who are to check in with my kids, risk dying, perhaps, prematurely, and then ending up in my Epcot Center.

My kids also have lists of who the people are who will be recieving all the properties for taking them over, which properties need to be demolished, who will be demolishing things, and how to remove those things that you must remove, and to where you will remove them, and

dispose of them, and in what manner you will dispose of them.

You will hand over every thing, and you will all comply, and those who are required to hand over their properties, after complying with removal demands, will hand them over, and then will move out and into my kids place, in accordance with the time schedule that my children have for you to follow. You are required now to check in with my kids, get every thing sorted out, and learn all the details, and then comply.

Those who do not follow these orders risk an early and, fortunate for us, timely meeting with death, and entrance to my Epcot Center for a long stay.

Erecting A Partition Blind On West Tropicana Ave.

The roadway, West Tropicana Ave. runs east to west, and west to east, and it is advisable to erect a pertition blind, so as to not disturb traffic, that comes down the side of the road, the parcel of land sits on, at very fast speeds, with people rubbernecking to see what is going on, as many people will possibly end up flying into the area, with their automobile, truck, gravel carrier, or eighteen wheeler spinnning and turning over, out of control, and then sliding off the roadway and into the collection site.

The traffic is very fact on West Tropicana Ave., and with the interest of the local area residents, who will learn about the collection site, and the activities at the collection site, there will be many hazzards arrising as a result. Some persons may decide to stroll through the area, to steal purses, or wallets, or cameras, and so forth, as there are many poor, indigent, or hopelessly poor, persons, in the area, who do not have any work, and who can not feed themselves, and they need to steal things, to sell, to earn a living.

Such people should be spoken to, and fed, and then warned not to act in an unrighteous manner, which means, please do not steal things, or damage the property, or any thing on it, and please do not get into fist fights, over insults, and disagreements with participants, about who is GOD, and so forth. There are many impoverished persons from South America, and Central America, who only know their local area witch doctor's teachings on voodoo men and voodoo women, and who know nothing but folklorish stories about gouls and ghosts, and people, or ghostly gouls, i.e., people immitating 'gouls', or mean and rotten people, who go 'boo!', or try to scare and rob people, in the night.

Electricity, Lighting, Etc., To Be Supplied By Nevada Power Free Of Charge, Or Else

The partition blind should be sturdy, tall, and break proof, so that vandals can not break it down, or climb over it. Lights for use at night, with the proper permissions for an electrical hookup from the Power Company, Nevada Power Company, will be granted, and provided by Nevada Power, along with all other neccessary, needed, safety lighting

hookups, to illuminate the area, fully, at night, so that it looks just like, or nearly like, daylight, or a well lit soccer areana at night, or a well lit professional baseball field, or football field, at night, and it will be given for free, lest we burn down Nevada Power, and kill all of their Lesbianists employees, and meter men, and all of their tawdry workers, who we do not wish to deal with. That means, we will blow up their buildings, and kill them all, unless they give us the electricity that we require. If we need to kill them all, we will then acquire all of their holdings, and we will operate all of them, ourselves. Fair Warning has been given, and consider that as a done deal, unless you wish to visit my Epcot Center.

Meat Vendors And Hispanics From Central And South America

An air of friendlyness, but caution, should be used. Men and boys are there to protect the women and girls. So, please work in teams, and do not let individuals, who might get kidnapped, and sold off to meat vendors, for a few dollars, or pesos, as it is, in Las Vegas, as the majority of such kidnappings and sales of human beings to meat vendors, the Lesbianists chain stores, such as Colonol Sander's Kentucky Fried Chicken, Burger King, MacDonalds, Jack 'n the Box, Wendy's, In-'n-Out, Fat Burger, Taco Bell, Dell Taco, and all the other, fast foods vendors, is by the locally landed hispanics from Central and South America, who need money, to stay alive.

Erecting A Partition Along South Decature Blud.

South Decature Blvd. also has much traffic on it, and there will be lots of people, rubber necking, to see what is going on, so a high, partition wall, made of lumber, should be erected down the side of South Decature Blvd. to prevent all such incidents of rubber necking, and reckess abandonment, from occuring.

The partition should be about ten to thirty feet high, and should be well constructed. Why so high? We do not want people climbing over it, to sneak into the area, to steal things, and to fight with people, and to cause trouble, and to come looking for young girls, and young boys, and helpless, elderly folks, and uneducated to the whims and ways of the downtrodden, brutal, abominant kids of mine, walking the streets of Las Vegas.

Yes. They are abominant kids of mine, and the proof of that is that their children come out as monkey people, and orangutan people, and chimpanzee people, and if possible, the hospital whisks the baby away from its mother, and disposes of it, in the prep rooms, used for killing incoming, abominant kids of mine.

Drawings On Demolition, Construction, Etc.

My kids have construction drawings for constructing all the facilities needed at the collection site for all the facilities that will be needed. They have electrical drawings for lighting, etc., health, fitness, and wellness facilities drawings, latrine facilities

drawings, showers facilities drawings, food and beverage eating and drinking areas drawings, and all other drawings related to all things that will be needed to be constructed, or altered in any way, for our project to proceed, including but not limited to, demolition of the cliffs, leveling of the entire area out to Harmon Ave. and up to Flamingo, and back to Tropicana, as well as what is to be removed and leveled between Jones and Decature. There are a few minor exceptions, such as the building that I am living in. Who will move where, to consolidate staff at this project, and who will be moving out, at this project, and what will be leveled at this project, are all detailed in the program specifications, my children have. My present quarters, will be my place of residence, as things move along, and in time, in accordance with the schedule for construction, a temporary facility for me will be constructed near the area but between Flamingo and Tropicana, and somewhere between Jones and Decature. Please see them for details. After the area is purified sufficiently, and after all the areas to be purified, are purified, and my children will decide on when that is accomplished, my children will then activate the technologies, and acquire the resources they need, and then they will build a more permanent settlement arrangement for all people concerned, who are staying on, if they decide to stay on.

The partical dismissive technologies and remissive technologies, for foods, and medicines, and other items that are needed, for continued survival, and for all other required purposes according to the specifications for the sexaling for a living programs, will all be provided to the participants who wish to stay on, and houseing for them, as well, will also be included. Parks will go up, and so will many other locally needed facilities. Many things will disappear, as my kids will partical dismiss the things and structures they need to remove, as they construct the new area, for all persons staying on in Las Vegas. My kids have a list of all the names of all the persons who may, if they decide to, stay on in Las Vegas, and not all of them, are local people, so you should all check to find out whether you name is on the list or not. All other persons, who are to be moving on, and all persons who do not wish to stay on, here, will be required to move into my childrens' present facilities, which they will continue to expand as we continue our program on this planet. We will eventually clear every one out of the area, inside and outside of Las Vegas and the Valley, and surrounding areas, and the world over, except for the persons whose names appear on the list, as houseing can be provided above ground, for participants in the juices spilling and areas purifying operations, by my children, if those persons wish to stay on and participate.

All other people will be required to move into the facilities my children have, and are continuing to upgrade, and expand, in their encapuslated living environement, in which, many people currently live. Persons in the encapsulated living environment, may also attend the collection site area activities, and future clearing activities, for purifying the areas with their pure, holy, powerfully cleansing,

purifying, cleericating [cle-er-i-cating], and GODLY energies filled, sexaling juices. Cleericating means, the same thing as clearifying. It is just a slightly different but related word from another a variant language of English, and to cleericate basically means the same thing as to clearify. When we get the areas, cleared enough, and purified enough, my kids will then start building things for the participants. All others will move below ground, and live in the encapsualted living environement, until they have earned enough money, with their friends, as talked about earlier, to purchase a lease on land, and acuire the lease on resources needed, to build a home, etc., for a large group of people, who will be living together, and working together in the sexaling for a living programs, and so forth.

When Will This All Begin?

As soon as people begin to comply, we will begin our efforts to clean up Las Vegas, to begin with, and then, the rest of the world, and then, the rest of our universe. It will take a long time, as we need to spill our juices, the lay persons, anyway, for some time, to come, as our universe is quite large, and so is the rest of it, that we are going to be recovering.

My Spilling Of My Purifying Sexaling Juices, And My Spilling Of My 'Prayer Time' Purifying Juices

I spill my juices, only for religious ceremonialing activities, during certain relgious ceremonies, and I don't spill my juices, on the properties, as I'm not set up to spill my juices, on the property, now, and will not be set up to spill juices, until I find an excuse for that, and an excuse for performing a religious hand prayer signaling ceremony that will require my spilling of my juices. It's pretty hard to spill juices, when there are no other persons working with me, and I do not work with lay persons, unless they are confirmed by me, and so there will be maybe, some confirmations, but not neccessarily so, as I do not know who is going to wish to be confirmed, and by the way, who ever it is I confirm, must realize that I am the Mother and Father of all human beings, animals, and living beings, and the Creator of my universe. There are not that many people who understand that, except for my kids, my working, unionized kids, and so it will be some time, yet, maybe a few hundred or more years, before some one realizes, 'Hey, he IS the Mother and Father of all human beings, etc., etc., etc.,"

Spilling 'Prayer Time' Spittle Generated While Praying

Until then, I'll use my spittle juices if I need to drop or drizzel any juices, that I generate while I am religious hand prayer signaling, as I don't like or care for the idea of jerking off in public, to spill purifying juices, in public, regardless of the fact, that I am GOD, so it ain't going to happen, any time soon. When I find a authentic 'believer' who realizes and understand that I am GOD, and so forth, I'll begin my public spilling of sexaling juices. I don't

mind it in private, but it is not going to happen in public.

Monkey Babies, Jimmy Carter, Oliver North, And The Lesbianists' Conspiratorial Bullshit Stories Of Adam And Eve, And "Jesus Saves"

Most people do not know this, but many births end in tragic loss of the child, because Jerry Falwell, Oliver North, Jimmy Carter, Ronald Reagan, George Bush, Jr. George Bush, Sr., and the rest of them, order and expect all the Lesbianists doctors to kill all babies born to people which do not look human. Doctors at birthing hospitals also comply, quietly, as it is hospital policy they can not break. If they go against it, they risk losing their job, and possibly losing their life. This is not a joke, and it is the Lesbianistgs policy of having all birthings in hospitals exactly for this reason, for disposing of non human looking babies, at birth, so that their bullshit creation by God, of a 'pair' of people, Adam and Eve, and that "Jesus Saves all good Christians", can not be contested, by logical proof of non human births to human being couples, or single parent women or girls. Abominant kids are born every day to my kids, on this planet, and they are all executed, or killed off by the local citizens, by their fright and fear of 'ghouls and ghosts' and 'goblins' in the night that go, 'Boo!'. These idiots, both the abominant South Americans, Central Americana, and all my other abominant kids, North American, Europeans, Russians, Chinese, Japanese, Thai, Philipine, and so on, must ask them selves why they are blessed with babies which are either not human or are abominant humans, or part animal humans. If they ask them selves these questions, they will find out the only answers are that these people born to them, are my children, and my children are born to them for reasons that have not been disclosed to them, before, by the clergical societies, i.e, the religions of the world, and by the other societies, set up by the Lesbianists, or by societies nurtured along as part of the Lesbianists' 'tragic comedy' of their toying with your lives for their humoring themselves, and for their amusing themselves. Once we get rid of the Lesbianists, and their ways of doing things, we will begin to see babies that are either not human, or are only part human, in animal bodies, and they will be born to all of you who are tummy mommies, and tummy daddies, if you birth enough children, to find out. How many is enough? About one in forty or fifty by my estimation, but depending on the person, it may be between thirty to eighty, from one person to the next. Take that to your pastor, and tell him or her, to stick it up his or her ass. It is the truth that animals are born to humans, all the time. Not only that, but abominant kids of mine, usually of the apey kind, but not always, are born to the 'normal' looking humans on our planet, and in our universe. We need not be afraid of these children, as animals, can be collected and put into zoos, and animal humans can be raised by the parents, or parent, in the case of a single parent. In time, we will adjust to this reality, and we will raise fine children, abominant animal humans, or human appearing abominant children. That means you are all abominants, and the Lesbianists are laughing at you, and at themselves as well, as they go around and kill and cravenly torture every

possible person they can. We will put an end to their craven ways, and we will make a wonderful universe for all of us to live in, in peace, and serenity, once we get started practicing my religion, and once we begin erasing, sufficiently, our karma and our karmic markups, with your purifying sexaling energies, prayers, and other activities, such as syncopated dance, syncopated excercise, syncopated sexaling, and so forth. You time it to the metronome at one thirty seventh, for now, and that will be fine. In time, we will get accurate metronomes, and then we will chance the pace, just ever so slightly, to push my kids along, as I explained about, for our wholesome and healthy universe, for all of us to live in, together with each other.

Punishment For People Who Practice Voodoo Religions Is Dismendment, I.E., Death

We will not be killing or executing children any more, at hospitals, or at homes, or in primitive, backwards towns and villages, or rural hideaway villages, where voodoo religions muster the people into peculiar states of mind, where they become entranced, and then begin mindlessly, acting like chickens, and birds, or fowls, or hippos, and so forth. There are too many of these types of so-called 'religions' in this world, and we are out lawing all of them, and punishment for adhering to them, will be a trip to my Epcot Center, as I have my children particle dismiss their bodies, and then dismend them, bit by bit, into their base components, and then have my children whisk them into my Epcot Center. We will bring every one up to the level of education every one needs to be at, to better understand my universe, and those who persist in abandoning their obligations, will be dismended with out further notice, after they are sent their last warning ticket, from my kids, in accordance with Gurkian Law. That also applies to the Lesbianists, and to every one else, who is unable to get the picture here, and get with the program. There will be no exceptions. And, this is not a joke. My kids have courses for you to educate your self in, to pull yourself out of the past Lesbianists' way of life and thinking, and into the new and current, reality, that we will be living in, for ever, from now on.

Local Businesses Will Have No Problems At All With The Collection Site And Will Have No Problems At All With The Activities Of The Faithful At The Collection Site

Walgreen's is across the street, on one corner, and Home Depot is on another corner. I don't think Walgreen's will have any problem with you using the site for your camping, for your meeting with others, for your sexaling with others, and for you and your friends' purifying sexaling activities in that park, i.e., the collection site. Home Depot, I don't think will have any problem with your use of the parcel of land, either, for those purposes.

What To Do If The Police Come?

Now, if the police come, and I'm there or not, I don't know what they'll say, but they have not got any right to say any thing to any one. Is that clear, Mr. Mayor of Las Vegas, and every one else in the area. I hope it is, as I am not going to stand for your interference or any one else's interference in my religion and in the relgious activities of people who wish to participate in my religion, sexaling to purify my universe. IS THAT UNDERSTOOD, MR. MAYOR AND EVERY BODY ELSE? I HOPE IT IS! AS A 'NO SIR' WOULD BE UNACCEPTABLE!

Now that we have an understanding, I think there will be no problems, and if there are, I will see what I can do about it, by calling my kids up, with my religious hand prayer signaling ceremonies, to see what they can do for you, to help you out, and to break the backs on law enforcement officers, and the Mayor of Las Vegas, and every other person, Lesbianist or not, who tries to interfere with me, or who tries to interfere with the people practicing my religion. I will not stand for any interference from any one, including Mr. George Bush, Jr., the current president of the United States, or any one else, such as the Mayor of Las Vegas, or the Governor of Nevada, or the Nevada Highway Patrol, or the Nevada Sherrifs Dept. or the Las Vegas Metro Dept. or with any other persons or parties, such as the Las Vegas Gaming Commission, or any other Lesbianists' or Lesbianistic organization set up by the Lesbianists, and that means all you church goers, parochial school teachers, and students, and others, and if any one interferes with any one who comes to my ministry's claimed parcel of land that I am purifying for setting up my ministry, and if any one hassels any one there, than who ever is visiting the collection site, to help to purify it, you have my permission to kill the persons attempting to interfere in any way at all, on sight, with what ever you have to kill them with. Please dispose of their bodies in the nearest trash dumpster.

DO YOU HEAR ME? MR. MAYOR. YOU ARE A DEAD MAN IF YOU EVEN TRY TO SEE WHAT MY RELIGIOUS FAITHFUL ARE DOING, AND SO IS EVERY OTHER PERSON ON EVERY SCHOOL BOARD AND CHURCH OR OTHER LESBIANISTS' COMMITTEE. IS THAT CLEAR, EVERY BODY? GOOD!

You will not interfere with my religion, and with my religious faithful, and they will come to Nevada, and they will come to Las Vegas, and they will start sexaling on that property as they see fit. Does every body understand that? I hope so. Now. Non responsive persons, who ignore my statements, will find themselves in trash cans, and trash dumpsters, every where in Las Vegas, and any where else, where there is a convenient trash can or trash dumpster. There are lots of them around, and people are throwing dead people into them, every day, across the country and around the world, and they all end up in landfill sites, and so there will be no added charges for our using the statewide Nevada Silver State trash retainers and containers, for however many others who need to be killed, and for my religious faithful to then place them into the trash cans and trash dumpsters. No charges should be levied by any other Lesbianists' trash collection company, around the world, as they are all owned and

operated by the Lesbianists, and we will not support them, in any way, what so ever.

If Mr. Mayor would like to be the first guest inside of one of the Nevada Silver State trash dumpsters, then he will try to interfere, in person, and he will be shot, point blank, in the center of his head. You will then kill him with three fivers, to make certain he is on his way to my Epcot Center, for his next trip out as a tummy baby. If the Governor of Nevada wishes to interfere, then he does so at the risk of being shot, killed, and made certain he is dead, with three fivers, and then after that, he will be deposited into a local or state trash dumpster, either here, in Nevada, or in California, or Arizona, or where ever it is convenient to dump him into a trash can, trash container, or trash dumpster.

Lesbianists Enjoy Eating People, Who Are Alive, As Well As Eating The Bodies Of Those Who Are Dead

You should let the state's vice mayor of Las Vegas's office know, who was shot, killed, and confirmed dead, after depositing three fivers into his or her head, and then where the body is, and generally when the body was dumped, so that they can get an idea of how decomposed the body is, and whether or not the body is in a land fill site. They can then check on it, and verify that the body will make it to the land fill site, if it isn't already, there, where all the other bodies, are ending up, unless they have already happened to have beeb eaten up by the Mayor, or by the friggen Governor, or by the Sherrif, or by another Lesbianist.

All persons are free to travel to Las Vegas, and they are invited to stay at the parcel of land that I described, and they are invited to make it into a nice camper trailer area for recreational vehicles, or for what ever other types of outdoors camping vehicles, travel trailers, caravan buses, or any other types of camp site temporary stay, housing and living arrangements you would like to use the area for.

Every Game Of Chance, Gambling Machine, Or Slot Machine Is Rigged, In Every Casino Around The World, With Only A Few Exceptions

If you will all sexal, regularly, to the best of your abilities, and help me to purify the area with your sexaling, undisturbed by any one, and clean it up with your purifying energies, you are more than welcomed to come and enjoy the area, and see what fine attractions, will be leaving Las Vegas, in the not so distant future, including the gaming commission, with all their phoney, rigged gaming systems, that the Lesbianists control.

The Lesbianists' Articles Of Participation

The Lesbianists have every game that you can possibly rig, controlled by electronics devices, or by slight of hand, mechanics, who control the gaming rooms, and gaming halls, so that only Lesbianists win any

money, that is worth mentioning about, and so that the Gaming Authorities, and the Mayor's office, and every other Lesbianist organization in Nevada, who has any one in their office, can then go and get the money the Lesbianist won, and get a percentage of it, given back to them, as they have arranged to do that, as that is part of their oath, and part of their sworn promises to do, as that is written out in their articles of participation, their rules for living upsite, not down below, in the labrynthine cities, and every Lesbianist must follow those rules, and when they win the Megabucks, and every Lottery in the world, they must give back money to the Lesbianists, as every game of chance that is run in this world, except for bingo, is rigged. However, even Bingo is rigged, in some ways, by people switching cards that look like winning cards, while players are not looking, and by other naughty tricks.

Every Lottery In The World Is Rigged

Every lottery in the world, performs the drawing out of the balls before a live audience, in most cases, before they actually air the show, and they have illusionary tricks they play, with the technologies they have, and they sucker people out of their money, daily, around the world. Las Vegas is no different, and they sucker every one out of their money, except for the Lesbianists, and they let some people, win now and then, small jackpots, on the gaming machines, and then after a winning streak, they set the machines the person uses, so that the person can not win a dime. They have the technologies for rigging every machine in Nevada, and across the country and around the world, so next time you visit one of their casinos, be sure and detonate one of our bombs, you can make, and destroy that casino. Is that understood? I hope so, as every day, millions of people are being suckered out of their hard earned money, they pay taxes on, through the nose, till they are practically choking, and the Lesbianists take it, and support their folley and games. They also support their folley and games with your revenues, that they make sure you lose, at every casion, and at every gas station, with a convience store, that has gambling machines in it, for you to deposit you money into. Every lottery in the world is rigged, and so if you spend money on it, if you are not a Lesbianist, you are just throwing your money away.

No Fair Play In Nevada, And No Fair Play In The World

There is no fair play, here in Nevada, or any where else, in the world, and I would like you all to know that, and become aware of that, and then I hope you will tell your friends about it, and then I hope you will destroy every single last one of their casinos, and gaming machines. We are not going to allow them to continue their frolicking at your expense, and we are going to destroy every last one of the Lesbianists, as soon as we can. If they prefer to surrender themselves to my kids, than we can allow them to live. However, if they do not surrender themselves to my kids, then we will kill them

all. And there are no 'maybe's' about that.

Sniper Shooting, And Miscellaneous Information

You have my permission to sniper shoot any police officer, park ranger, sherrif, or other person, plain clothesed police officer or detective, with or without a gun, on sight with your scoped rifles, and targeting assistant who will determine range, from your bunkered in the hillside, shooting site. Any hotel in the area, which might harbor shooters from local police, sherrif, or SWAT team operations groups, you have my permissions, and blessing, or go ahead, and my 'okay, and 'approved for action' sight of appeal. Sight of appeal means, my blessings, based on your determination as per your good judgement.

One hotel that is clearly the most convenient, and the closest with in shooting range, at close range, is the New Orleans Hotel. Hotels within shooting range, at a distance, are the Palm's Hotel, The Rio Hotel and Casino and its seperate tower wing, and a few others, off in the distance. You'll have to come and look at them from the approximate location of the site after you determine where every thing is, to locate and determine for your self which hotels and towers need to come down, and what you will need to bring them down. There is a tower off in the distance, a new hotel, that is going up, that I do not know the name of, but is clearly within shooting range, and needs to come down, and people are on it, daily, welding, and you can't miss it, if you look in the north easterly direction from the site. There is the Stratosphere Hotel and Casino, which also needs to come down, which is further over to the west from the new hotel wing that is going up. There are many scaffoldings in the area, that also need to come down with explosives, fracturables rocks, fuels, chlorine, and high temperature minerals particles ignition, and particles burnings bombs. There are probably a number of other landmarks, hotels, casinos, bars, restaraunts, trailor parks, trailors, houses, apartments, condominiums, near or off in the distance, that also need to come down, and need to be demolished with my light weight explosives fuels, gunpowders, metals particles, and chlorine plastique explosives bombs.

You will destroy them all, and you will come prepared, or be prepared to acquire all the demolitions needed to destroy them all, as well as to destroy all the local police and sheriff's many Metro offices, SWAT Teams offices and units, Fire and Rescue Ambulance units, Lesbianists' Hospitals, and other Lesbianists facilities, throughout the Las Vegas Valley, Henderson Nevada, North Las Vegas, Pahrump, Mesquite and the whole Southern Nevada, westward to San Diego, California, northward to Los Angeles, northward to San Francisco, California, northward to Berkely, California to Oregon, and Washington State, and back down to Reno Nevada, Arizona, New Mexico, Albequerque, Houston Texas, Dallas Fort Worth Texas, and all areas where there are tactical SWAT team units, military units, militia units, as all militias are organized

and operated by Lesbianists, despite popular beliefs that they are independent of the government, and anti government, as we often see on the "TV for the Brainless", as they are often refered to, i.e., the general public.

You will destroy all law enforcement offices, and personel, and all military and militias. All governments, their offices, and employees, are to be destroyed, and all personel are to be executed, except for those who take it upon themselves to execute the Lesbianists among them. My kids have a full list of all the places and structures that need to be destroyed, and demolished, and so please see them for that information.

Your Orders Are To Kill The President Of The United States And His Wife

And to repeat, your orders are to kill the president of the United States, George Walker Bush, Jr., his wife, Mrs. Barbara Bush, Jr., and all of his and his wifes' Lesbianists' associates, pretend relatives, and friends.

We are not going to let this stand, another moment, and if they do not surrender to my kids, you are to execute them all. My kids have a list of names, of those, who have not surrendered, as yet. Please see them for and ask them for that list of names of persons who have not as yet, surrendered, and who need to be executed, post haste, immediately, or, ASAP.

United States President George Walker Bush, Jr., is no exception to this, as he has not surrendered, as of yet, and that is confirmed. Neither has any of his colleages, or congressional office holders and diet or congress members, except for Ted Kennedy, and one or so others, and maybe a cabinet member, one or there abouts, but I haven't confirmed that, yet. There are some members of the congress who are not Lesbianists, and you can get their names, on a list from my kids, as well.

I am looking for the handbook, or even just the
schematic, for the General Radio model 1304-A Beat Frequency
Oscillator. This is an earlier version of the more familiar
1304-B but differs from it very considerably. I can't find
the book on any of the usual free sites and its not listed
on any of the pay-for sites I tried. Any suggestions would
be very much appreciated.
I have also posted a request on the Test Equipment list.

Texas's Lesbianists' Latest 'Vaccine' And Texas's Attempts To Destroy Women's And Girls' Vaginal Lining And To Destroy Women's And Girls' Cervical Lining, Causeing Stillbirths To Increase, So As To Prevent The Successful Birthing Of Children - Latest Lesbianists' Vaccine Will Cause Numerous Problems - Execute United States Of America, State Of Texas, Governor Perry And Family - Underground Books Distributor's For Militia Types Folks - Information On Bombs Making And Detonators On The Web - Solar Flares And Flare Igniters - The Lesbianists' Balooney On Minus Charges As Opposed To Positive Charges - The Lesbianists' Maps Of The Brains - Execute The Current President Of The United States Of America, George Walker Bush, Jr. - Lesbianists Who Decide To Sexal In My Religion With Lesbianists And Non-Lesbianists' Persons - Citizens By Proxy - Temporary Full Time Citizens - What To Do About Untimely Pregnancies, Health Issues, Medicines, And Regroverative Formulas - Medical And Housing Benefits, And Other Health And Work Related Benefits - When Can People Begin To Come So As To Be Able To Participate? - Sniper Points, Places Where Snipers Shoot From - Pocket Knives, Construction Tools, And Miscellaneous Daily Life Management Tools And Equipment - Hookups For Travel Camping Vans And Similar Vehicles - Cleaning Up The Area And Throwing Away The Garbage - Schedule For Leveling Of The Ground And Hills In The Area, Removal Of Unsightly And Smelly Garbage - Setting Up New Facilities - Fountains And Showering Lamponeers - Restaraunts, Clubs, Lounges, Eateries, Cafeterias, Bars, Pubs, Bicycle Paths, And So Forth - Dealing With Criminally Minded Persons - Alterations, Modifications, Changes, Clearing Up And Removal Of Garbage In The Areas, And Additions Time Schedules Updated: 12-02-07 Rev.a.00.a 02:30 PST

Texas's Lesbianists' Latest 'Vaccine' And Texas's Attempts To Destroy Women's And Girls Vaginal Lining And To Destroy Cervical Lining, Causeing Stillbirths To Increase, And To Prevent The Successful Birthing Of Children

The latest attempt by the Lesbianists' governments of the world, near by my computer window, on the internet news services, to destroy and toy with the human population of this planet, has been launched in Texas, and is targeted at women and girls, and their ability to have children.

See the article at the end of this post.

The new vaccine, which is mandated by Governor Rick Perry, who signed it into law, and is now obligatory, unless you protest it, and go to court, and spend years fighting it, as an individual or small group of claimants, will destroy the vaginal cervical collar and the lining that holds every thing in place, and supports the interior of the vagina, thus making it impossible to carry a fetus to term. The vaccine is also targeting the brains fibers throughout the human body, and the fibers of the brains in a woman's or girls' body will slowly rot, and decay as they are eaten up by tiny animals that eat these energies conducing fibers, synapses, relay switches, and other related energical brainal related things and dings thoughout the body.

Latest Lesbianists' Vaccine Will Cause Numerous Problems

It will also speed up the eating away of the enamel of the teeth, and of the bones in the woman's and girl's body, her fingernails, and her skin membranes NS membraneous tissues throughout the body, and on the exterior of a woman's and girls' body, making the women and girls grow older looking at ever more younger ages, and making women and girls susceptable to skin cancer, melanoma, herpes, genital warts, other infestations of animals in the skin, and other skin related membrane destructing colonies of animals, that they use from out of their Bio Chem War encyclopedia of how to destroy human beings, with poisonous and health problems causeing crystals cages animals of all kinds. Especially numerous are the Bio Chem Warfare crystals cages animals of the petroleum industry's based kind.

The vaccine is no different from any other of the Lesbianists vaccines aimed at destroying the health of the people who live on this planet. It is compared to the 'polio' vaccine, in the news article, and that was similarly an attempt at destroying the health of the human being, by making the human being incapable of haveing any sexual orgasming capabilities, by killing off all the sex related animals and bugies in the body, which make sexaling juices, that make eroteming and orgasming possible.

Thus, this latest attempt at destroying the health of the people who live on this planet, locally, in Texas, and that I know of, anyway, is nothing more than the Lesbianists toying with the people who they are here to amuse them selves with by destroying them, little by little, over a long period of time.

Execute United States Of America, State Of Texas, Governor Perry And Family

This will not stand, and you will all destroy the capital of Texas, and Governor Perry's mansion, and the Governor and his wife, and their family, pretend or otherwise with my fracturable rocks and fuels chlorine and explosives, etc., bombs, that you will make in your home's garage, or workshop, safely.

Underground Books Distributor's For Militia Types Folks

Use the delayed timer invention, that is a workable time delay detonator, that I've explained about, especially if you use black powder gun powder, mixed with axel grease, turpentine, benzine, chlorine, using also some Elmer's glue, prior to mixing with chlorine, and then set it in a warm cupboard, to ferment for a few days, to then turn into a nice plastic explosives mixture for detonating with the string of flash bulbs wired to the alarm clock trick, as described by Ragnar or by one of the other bombs making specialists, in their sub culture literature for militia types folks, who wish to destroy the government.

They find the list of names of all the people who request the literature, by mail, and then they go and watch them, with their surveilance technologies they have, and then they either capture and torture them, and then kill them, or they just make sure they are die, in a fatal car accident, or whatever.

Paladium Press is one of the Lesbianists' book publishers, and there are others, and this one is affiliated with the National Rifle Association, a Lesbianists organization.

This publisher has titles sold to underground books distributors, and you can find a number of underground book distributors on the internet, which carry more titles than Palladium press.

Delta Press, who publishes their books and paraphenalia distribution listings magazine, 'Delta Force' is one of these distributors of interesting underground literature.

http://www.deltaforce.com/catalog/page30dp.html

'Home Made Fireworks', is one web page to look at, if you have the time.

http://www.deltaforce.com/catalog/page28dp.html

'Booby Traps, Explosives and Black Medicine', is another useful page to look at, as well.

http://www.deltaforce.com/catalog/page30dp.html

There are a number of other distributors of underground literature, and some have better selections than does Delta Press.

In any case, with a little research, there are plenty of 'timed detonation devices' drawings, and explanations, for you to view, and learn from, that will help you to construct a timed detonator, that will allow you to safely set off one of your plastiques bombs made with my explosives formulas.

Paladin Press, you can find their books at Amazon Books on the web, another Lesbianists owned corporation, is another publisher of interesting underground literature, that can be useful for you to study and learn from.

Paladin Press can be found at, http://www.paladin-press.com/

Books for supposed 'Professionals' who are anti terrorists professionals, that allow them to detect the different types of bombs people can make, and then use to destroy others, is sort of a tounge in cheek joke of the Lesbianists, for luring in people who wish to find information on bombs and explosives.

There are many useful books published to help beginners understand the basics of bomb making. The idea is to use the information for professionals who wish to understand the craft of making bombs, and detonating devices, and then use that information to build your bombs and your detonating devices.

The flash bulbs wired to an alarm clock with matches and ignitable phosphates glued to a string of flashbulbs, wired properly together, then crushed, so as to expose their flash and heat ignition coils filaments, for your detonating heat energies ignition needs, is one of the basics and you can find it in one or another of the underground books on bombs making and detonation devices making for 'professional' anti terrorist's private investigator or bombs detection professionals types.

This is one of the ways the Lesbianists lure in persons who know nothing about weapons, and then they find out who they are, and then they make friends with them, and toy with them, and introduce them to their Lesbianists' friends, and hang out with them, and pretend they are all friends, then one day, they all attack the person, and torture the individual, and get their kicks, amusing them selves, by ripping the person up, or by hanging, and nailing the person to a wall, with a nail gun using, approximately, three inch nails, and then hammering in longer, seven inch to twelve inch nails, or larger ones, or other similar nonsensical, childish, but fiendish behavior.

The "BRUTAL ART OF RIPPING, POKING & PRESSING VITAL TARGETS"
"by Loren W. Christensen"
http://www.paladin-press.com/detail.aspx?ID=1441

Is a beginners guide to ripping people apart, one arm, or leg, at a time, or with team work, one half of a person can be ripped from the other half, if you hold the right bones in place, and then, using teamwork, rip the person into two or more pieces. This book gives a person a preliminary sense of what he or she can muster, as an individual who attempts to rip at a person, and tear the person apart, one limb at a time, or with friends, how to rip a person up, one piece or more, at a time. Ripping people up is accomplished best, if they are unconcious. If they can not fight back, or resist, it is easy to rip a person apart, if you have the needed strength. Since many people have ancestors who were monkeys, chimps, orangutangs, guerillas, and so forth, with tremendous muscles strength, there are lots of very tiny persons, with phenomenal strength, and they can easily rip a person in two, by them self, if they try.

Books on booby traps for law enforcement personel, are simple descriptions of bombs that they may or may not encounter, and there may be some useful information in some of them such as,

"BOOBY TRAP IDENTIFICATION AND RESPONSE GUIDE FOR LAW ENFORCEMENT PERSONNEL"
"by Tony L. Jones"
"This manual teaches cops and other law enforcement personnel all they need to know to recognize a booby trap and respond properly. Find out where booby traps are most commonly employed; the 11 physical signs that most often signal a trap; what to do (andnot do) if a trap is suspected or found; how to safely search a building, outdoor site or vehicle; and the one indicator that practically guarantees that a building has been booby-trapped. Shows more than 90 different booby traps in place. For academic study only. 5 1/2 x 8 1/2, softcover, photos, 80 pp."

There are others, which you can also find, that will provide schematics, and drawings of useable ambush related devices, and detonators for them.

"Contingency Cannibalism", sold through Paladin Press, and other 'underground' book distributors, is one of the Lesbianists' favorite books, that help them to track persons who they would like to later, cannibalize, themselves, as a joke on the person.

"CONTINGENCY CANNIBALISM"
"Superhardcore Survivalisms Dirty Little Secret"
"by Shiguro Takada"
"This twisted, tongue-in-cheek look at cannibalism as a last-resort survival option analyzes real-life case studies and historical episodes of cannibalism. Then it examines the hard-core decisions and gruesome details one must know in order to partake in this grisly practice. Recipes included. For entertainment purposes only. 5 1/2 x 8 1/2, softcover, 160 pp."

The Rusksack, "Survival Information Clearinghouse", is just one club of members of mainly Lesbianists, who have fun toying with the people who live on this planet.

Information On Bombs Making And Detonators On The Web

For information on making detonators, and other bomb related stuff, please see this web page as it costs nothing.

http://www.bombshock.com/archive/Homemade_Bombs/

Solar Flares And Flare Igniters

A solar igniter as talked about in the article on page,

http://www.bombshock.com/file9/crtrmkr.txt-Crater_Makers-932.htm

'Crater Makers', is a solar flare igniter, a device that is used in solar flares, or night time distress signal flares, that ignite the flare, by sending an electric battery current into the flare phosphates holding tube, down a wire, on an ignition circuit, and then igniting the distress signal flare.

You can find solar igniters inside of distress signal flares that are used on boats, for shooting up into the air, with a flare gun for maritime use, that will send the distress signal flare up into the sky, if you have the flare gun pointing in that direction, and then at a certain altitude, a trip switch circuit is activated, due to air pressure, or due to timing from time of departure of the distress signal flare from the flare gun barrel.

You have to exhibit extreme caution, when taking a flare apart, as it can detonate, accidentally, and they are not made in a way so that people can safely take them apart, and people who try to take them apart, are accidentally injured, on a regular basis. Do not use this, if you do not know any thing about demining, as a professional mine deactivating specialist in the military, or with military training. This is best left up to the professionals, and is not meant as something the average house wife, business man or business woman, or chemistry or other studies, school student, should attempt.

You can use a flash bulb, and get the same results, if you glue some gun powder and phosphates to the flash bulb housing, and then crush the glass, and then wire it properly to a common house morning wake me up, alarm clock with a striker bell and a striker that moves back and forth. The circuit is simple, and you can figure it out with little difficulty.

The Lesbianists' Balooney On Minus Charges As Opposed To Positive Charges

Remember the minus sign on a battery is where all the activity of the little energies kids is going on, and the Lesbianists purposefully teach that the positive side is where the current is moving out of, and around towards the negative side of the battery. The Lesbianists teach that the active side of the battery is the plus or positive side, or the side with the plus sign on it, when you look at a common house hold nine volt battery, and that the non-active side is the negative side, or the side of the battery with a minus sign. This is false. The side with the minus sign on it, is the active side, and that is where you do not want to wire any thing to, unless you know what you are doing. The positive side has no activity going on, and is safe to touch, but the other side is not safe to touch, and the testing meters are wired to show you that the reverse is true. They have tampered with the design of testing meters, so as to support their allegation and falseity, that the minus side is where there is no activity, contrary to the truth.

That means, that, the flash bulb igniter system and the flash bulb itself should indicate that one side is the positive side, for the

positive wire to be attached to. You had better check carefully, and make sure there is no mischief here, as you do not want to detonate your igniter, accidentally. Ask a qualified electronics specialist to do all your wiring of your detonators, as he or she is the only person qualified to wire these types of detonators.

The Lesbianists' Maps Of The Brains

It's rather confusing, the way the Lesbianists have reversed things, and have messed around, so as to thwart your attempts to make nice detonators that work every time, unless you have a normal set of brains, which unfortunately, I have not got a pair of, or triple set, or more of. That's sort of a joke. On a magazine, yesterday, I saw how the Lesbianists teach that one part of the brain is for speech, and one area of the brain is for speaking, and one area of the brain is for sight, and one area of the brain is for logical thinking, and one area of the brain is for signing, or one area of the brain is for artistic inventioning, and so forth, but that's a lot of hog wash.

The brain is not partitioned in that way, and they know it, and they are misleading every one, and laughing at all of you while they are doing it, with their 15th to 17th century style drawings, that they have plastered on all the Time magazines, or what ever magazine cover it was on, that I saw in the check out lane, at the super market, yesterday. You have kazillions, and more of parts to your brains, and there are so many, it is unlimited, nearly, and your brains are so complex, and you have got brains in lots of other places in your bodies, other than in your head, and I'm not going to go into that one, now, but the Lesbianists are lying through their teeth, when it comes to this type of pseudo historically backwards, archaic, or cave dwelling human's notions on science, that should insult a first grader, or kindergarden school student, or preschool student.

In any case, ask your local electronics' specialist or house hold electricians' specialist, or handy man repair persons, who work for house hold water heating devices installation companies, or other electrical home appliances sales and installation companies, who also get confused, from time to time, as I've witnessed them, personally, blow up breaker circuits.

Get a qualified, and that's hard to find in so far as I've witnessed them at work, electronics' specialist to wire your detonators, or go take a course with my kids, as they have courses available on wireing such devices.

There is no minus charge, and there is no positive charge, and that is what you should understand. There is a side to the battery where there is lots of activities going on, and that is the minus sign side on the battery. The positive sign side on the battery is where there is little to very little or nearly no activity, but no activity is not the truth, either, as there is activity, you just can not measure it with todays' electronics measuring devices, as they are not

technologically sophisticated enough to be able to detect the activity, though I'm sure there have been intrepid scientists who discovered that both sides of the battery have activity, and then they were shot and killed, after that discovery, by a Lesbianist assasin, or by a hired assasin, assigned or paid to kill the scientist who discovered that there is activity at the 'minus' side of the battery as well as at the 'positive' side.

That means, that you need only concern your self with the 'minus' side, since you will not be able to detect any thing at the positive side, unless you use the reverse wired electronics and electrical energies detection devices that the Lesbianists market through Tandy, or Radio Shack, and at Sears, and so forth.

It gets confusing, a little bit, doesn't it. Anyway, go and take a course at one of my kids classes, after you sign in, and swear in as a jr. member to our new country, which I haven't sworn on to, as yet, or joined - but though I am the boss of, regardless - since my kids do not speak to me, on a daily, or weekly, or other basis, and I just happen to be able to know what they are doing as they tell me what they are doing, through some secret port hole in one of my brains some where, in my toes, or nose, or who knows where, as they telegraph or some how signal in, using semiphore signaling, or probably hand signaling, that my brain then catches, and then passes on to me, their messages that they signal in to me, and the news, as well, about what they are doing, and about what is going on with them, and about what is going on with some other things, as well.

Since I am GOD, I happen to have a right to know this stuff, what they and every body else is doing, on a daily basis, but they haven't told me how my brains catch their information, yet, or the other information that gets there, some where into my one or more of my brains, and I haven't figured it out, yet, myself, either, though I think I know something, a very little something, about how it works.

This does not mean, that my brains are unreliable - except for my memories areas of my brains, in particular - but that I am just waking up to what is going on, here, and I have a few kazillions of years to work out every thing, or some of the basics, any way.

In any case, you have all been snookered by them, with regards to their non sense sciences, and you are being laughed at, and toyed with, daily by them. That happens to be the truth, whether we find it pleasant or not.

Execute The Current President Of The United States Of America, George Walker Bush, Jr.

In any case, the Lesbianists are a twisted group of individuals, who toy with the people who live on this planet. Mrs. Hillary Clinton, Bill Clinton, George Walker Bush, Jr. President of the United States, his wife, Barbara Bush Jr., George Bush, Sr., former president, and

his wife, Barbara Bush, Sr, are all gagsters, or jokesters, who wish to only toy with you, and eat you, or deprive you of your life, and of your rights, in fiendish and horribalistic ways and manners.

They are all to be executed, especially George Walker Bush, Jr., President of the United States of America, currently residing at 1600 Pennsylvania Ave. Washington DC, in what they call the White House. You are to kill them all, and send every last one of them to my Epcot Center, as soon as is convenient for you.

Lesbianists Who Decide To Sexal In My Religion With Lesbianists And Non-Lesbianists' Persons

If any Lesbianists decide to sexal in my religion, with their friends, and their friends may include other Lesbianists who decide to sexal, as well, as well as, other people they know, then they may begin sexaling with their friends in my religion, however, they must have a pentative attitude, and they must say they are sorry, and they must now and then, when they feel they wish to, and feel emotionally and mentally capable of speaking about it, they can talk with their friends who they are sexaling with, and with others who wish to listen as well, and they can denounce the Lesbianists by telling people about the things the Lesbianists do, and did.

If they decide to do this, this is the same as surrendering, and my kids will protect them from other Lesbianists who might want to harm them. They have not sworn in, as a citizen of my and my kids' country, and as citizens of our country that every one is swearing in to as citizens, but it is sort of a promise to swear in, informal gesture that they are committed to, once they begin sexaling with their friends, and with other Lesbianists, who also wish to sexal and in time, denounce the Lesbianists with them.

Citizens By Proxy

By denouncing the Lesbianists organization, and by telling people about what the Lesbianists do and did, they are essentially stating they are sorry for what has happened, and that is a pentative attitude, and with that pentative attitude, they are accepted as citizens, by proxy.

Temporary Full Time Citizens

Citizens by proxy means they are accepted by my kids as pentative persons, who wish to join our country, and who there with, qualify as citizens of our country, in an informal manner. Citizen by proxy means, they give up their old citizen ship, to whatever government they used to belong to, and they are taken in, as temporary full time citizens.

Temporary full time citizen is a term that means they are full time citizens, but on a temporary committal agreement, and that will be made permanent when they have the chance to meet with my children, and

then can swear in, as a permanent full time citizen.

They can then participate at the collection site, in the activities that will be going on, with others, who wish to participate, as they spill their juices, and purify the area with their sexaling juices.

What To Do About Untimely Pregnancies, Health Issues, Medicines, And Regroverative Formulas

My kids will deliver to them, to the men and to the women who surrender and become citizens by proxy, and temporary full time citizens, the needed medications that will help to make their bodies, wholesome and well, and regroverated, as well as the medications that are needed to prevent untimely pregnancies.

Medical And Housing Benefits, And Other Health And Work Related Benefits

My kids will make certain that they will be given the right medications, and my kids will also provide all the same medications for each individual who participates in the collection site activities to purify the area where we will one day set up my ministry with my kids assistance. My kids will also set up other facilities, as well as the ministry facilities. The other facilities will be scattered through out the valley, and they will be the houseing units and other facilities for people to use to become physically fit, well, and well nourished, and healthy, such as gyms, aerobic studios for practicing aerobic dance, and aerobic excercises, as well as sauna and health spa, and swimming, tennis, badminton, cricket, and other sports facilities for baseball, rugby, foot ball, for those who wish to play a friendly game of foot ball, now and then, with the needed bleachers, lighting, and other supportive facilities for allowing persons to attend and watch the games that are going on, not only for foot ball, or for base ball, but also for tennis, soccer, rugby, and all out door sports facilities that will be needed.

When will my kids set up these facilities? They will set them up at the same time or shortly there after, as my kids begin to set up my ministry facilities, and the needed facilities for living and working in the valley area, sexaling for a living.

At that time, the citizens by proxy, and all other persons who have not yet sworn in, but wish to, will have the opportunity to swear in, and then they can enter and use the facilities full time, twenty four hours a day, without any further discussion about it.

All people who participate in the collection site activities, are also citizens by proxy, and as such, will automatically qualify for all medicines, all health supportive medical formulas, and all youthfulness prolonging, or regroverative formulas, that will feed all the amoebes, and other cells, or living beings in your bodies, and that will feed all the living beings in your bodies, that will then allow you to enjoy full regroveration of your body and rejuvenation of

your youthfulness, youthful energies, and of all the other health benefits that accompany a youthful body, such as more energy, a stronger libido, a more healthful body, and so on.

When do people begin this participation in the collection site activities? As soon as they come out here, to Las Vegas, and arrive in their camper trailers, or caravan buses, or other vehicles, or with their camping gear such as tents, and cooking grills, and so forth.

When Can People Begin To Come So As To Be Able To Participate?

How soon can people begin coming to participate at the collection site in the activities that will be on going at the collection site for some time to come?

They can begin coming to participate any time. My kids will watch out for the safety of all the people who come to participate in the collection site activities. My kids will prevent accidents such as current Lesbianists shooting at people at the collection site, from high rise towers, scaffolding, tall cranes, or from hotel and casino properties owned by the Lesbianists, and from other tall condominium and also from tall apartments buildings and also from normal sized, two or three storey, to eight or so stories, apartment buildings, in the area. Of course, my kids will prevent accidents from happening such as shootings, from all possible locations, and not just from those named structures and locations.

Sniper Points, Places Where Snipers Shoot From

There is no need to blow or destroy them with explosives, in Las Vegas, as there will be no way any one can use those hotels, and other structures, as shooting or sniper points, places where snipers shoot from, to harm any one who is participating at the collection site, in the collection site activities.

In time, every thing will be worked out, and all the people who must hand over their companies, or disolve their companies, and sell or get rid of the assets of their companies, all of that will be in compliance with my childrens' instructions with regards to it, as I've stated about it, already, in brief.

Once the facilities are set up by my kids, and people swear in formally, then my kids can begin to pay people their earned income, for the work they did as they sexal for a living, and for their work, as they spill their fluids, to purify the collection site, the collection site area, and the general vicinity.

Pocket Knives, Construction Tools, And Miscellaneous Daily Life Management Tools And Equipment

No one needs to bring weapons to the collection site area, or to Las Vegas, as they will not be needed, and pocket knifes are okay, and construction tools are okay, but they will be for daily use

activities, only. Daily life management tools are forks, knives, spoons, chopsticks, plates, dishes, glasses, coffee cups, can openers, bottle openers, cork pullers, and these types of things, as well as all the other types of kitchen use tools for cooking food, for eating food, for drinking beverages, and for the collection of garbage, and food wastes, and for cleaning up their eating and cooking utensils, such as portable wash basins, and portable gas stoves, or fixed stoves, fixed wash basins, fixed showers in camper trailors, and in caravan buses, and so forth.

Hookups For Travel Camping Vans And Similar Vehicles

We have no hookups at the site, for water supply, electricity, or sewage, as yet, but the instructions that my kids will make available to persons who come in to my kids' underground facilities - the protected and encapsulated living environment - those persons who go in to recieve the instructions, and other information they must recieve on companies and assets, and persons moving on, and on persons staying, and other information needed to successfully carry out the removal of hotels, and the demolition of buildings, etc. which my kids will handle with the technologies they have available to them for their use for these purposes, and for other purposes.

Cleaning Up The Area And Throwing Away The Garbage

My kids will also handle the required steps for clearing up of the litter and garbage in the area, all of Las Vegas, Pahrump, Henderson, Laughlin, Mesquite, North Las Vegas, Arizona, New Mexico, California, Utah, and beyond, above ground and below ground, and for cleaning up the areas, and for removing the underground and above ground garbage, or city buildings and Lesbianists' structures, and all structures that are no longer needed, train tracks, airports, roadways, bridges, parks, hospitals, medical clinics, and so on, all of which will no longer be needed.

Schedule For Leveling Of The Ground And Hills In The Area, Removal Of Unsightly And Smelly Garbage

Initial leveling of the grounds' areas, leveling of the uneven surface areas, and leveling of the sloping areas, and of the tiny hills, and other uneven and unuseful features to the area, such as hills, low cliffs, and removal of unsightly, smelly garbage, will be done by my kids, with the technologies they have available to them, according to the schedule for making these types of changes, and cleaning up of the area, so as to make the area, one hundred percent, useable for collection site activities, for people to then come in and use the area as a collection site.

Setting Up New Facilities

My kids will take care of all of that, and they will take care of all of the work and tasks for setting up a private collection site area - for spilling purifying sexaling juices, to purify the area - in

accordance with my kids' schedule for these works and tasks for setting up a private collection site area, with tall side walls, and barricade walls, to prevent people from rubber necking as they drive by, so as to prevent car, truck, automobile, motorbike, and bicyle accidents. My kids will also set up the latrines, and other needed hygenics facilities, sleeping accomodations, eating facilities, rehydration facilities, co-opted bathing facilities, sports and excercises facilities, and other facilities.

Co-opted facilities means facilities used co-optively by men, boys, women and girls. Co-optively means, in cooperating measures with each other. Cooperating measures means, each of the four groups of people, men, boys, women, and girls, will work together, to keep the facilities sanitary, clean and healthful, neat and tidy, and safe for use, keeping young children from playing on the stairs for the elevated latrines, and keeping young children from getting in the way of asscending and descending users of the co-optively, or cooptively managed facilities.

Fountains And Showering Lamponeers

My kids will also use their high tech teletransportation technologies for removing toddlers from the stairs, and for placing them in a much safer location, such as in a near by sand garden, or play area, with sandy areas, and with toys to play with, and with cold showers, or showering fountains, people can refresh themselves under, and with fresh water to drink.

Lamponeers are showers that shoot up from sprinkler systems embedded in the paved surfaces, or concrete like surfaces, that shower water up and over the area, up and above and over persons who are there, to cool every one off.

Restaraunts, Clubs, Lounges, Eateries, Cafeterias, Bars, Pubs, Bicyle Paths, And So Forth

Bicycle paths, mini bike paths, walking paths, with rest stations, for refreshments and food, will be set up, and restaraunts and other facilities will be set up, nearby and they will be accessable by following these foot paths, bicyle paths, waling paths, and so forth.

All needed facilities for all parties, such as accomodations, living quarters, health clinics, excerize facilties, swimming pools, saunas, spas, and clubs for eating and mingling with persons, either in light weight evening wear and garments, or partially naked, or in the buff, will also be set up by my children for the use by all legitimate collection site participants. Gurkian Laws apply, and no other laws, such as local area laws, will be enforcable. Police and others will be turned away, and the rights of participants at the collection site area, will be protected one hundred percent, as we begin to change over to the new Gurkian Laws we will all be living by, from now on.

Dealing With Criminally Minded Persons

Any violators of the Gurkian Laws, codes, statutes, and so forth, my kids will arrest, and detain, and then place into prison cells, and then sentence them, in accordance with the sentencing requirements under Gurkian Laws, etc., and they may end up doing humiliatory punishments, or community clean up activities. In any case, they will be arrested by my children, who will use their high tech, biometrics and teletransportation technologies, and their other integrated technologies that they have, to swiftly remove the violators of Gurkian Laws, from the collection site and from the collection site area, and vicinity, and that will effectively cancel out their participation, until sentencing has been given, and until penalties have been leaned.

Penalties have been leaned, means, they have undergone sentencing, and the penalties have been enforced upon the violators, i.e., the guilty parties.

Alterations, Modifications, Changes, Clearing Up And Removal Of Garbage In The Areas, And Additions Time Schedules

These modifications, alterations, changes, and additions, etc., will occur over a period of time, as my kids have a schedule for all of these changes, modifications, alterations, clean up, and additions, etc., and they must stick to the schedule, so after you arrive, if you do not see some thing you feel should be there, by then, it is not there because it is not on the priorities facilities and priorities changes, etc., schedules lists.

Captain Off The Bridge.

Texas requires cancer vaccine for girls

By LIZ AUSTIN PETERSON, Associated Press Writer

AUSTIN, Texas - Bypassing the Legislature, Republican Gov. Rick Perry signed an order Friday making Texas the first state to require that schoolgirls get vaccinated against the sexually transmitted virus that causes cervical cancer.
ADVERTISEMENT

By issuing an executive order, Perry apparently sidesteps opposition in the Legislature from conservatives and parents' rights groups who fear such a requirement would condone premarital sex and interfere with the way parents raise their children.

Beginning in September 2008, girls entering the sixth grade - meaning, generally, girls ages 11 and 12 - will have to get Gardasil, Merck & Co.'s new vaccine against strains of the human papillomavirus, or HPV.

Perry, a conservative Christian who opposes abortion and stem-cell research using embryonic cells, counts on the religious right for his political base. But he has said the cervical cancer vaccine is no different from the one that protects children against polio.

"The HPV vaccine provides us with an incredible opportunity to effectively target and prevent cervical cancer," Perry said in announcing the order.

"If there are diseases in our society that are going to cost us large amounts of money, it just makes good economic sense, not to mention the health and well-being of these individuals to have those vaccines available," he said.

Merck is bankrolling efforts to pass state laws across the country mandating Gardasil for girls as young as 11 or 12. It doubled its lobbying budget in Texas and has funneled money through Women in Government, an advocacy group made up of female state legislators around the country.

Perry has several ties to Merck and Women in Government. One of the drug company's three lobbyists in Texas is Mike Toomey, Perry's former chief of staff. His current chief of staff's mother-in-law, Texas Republican state Rep. Dianne White Delisi, is a state director for Women in Government.

Perry also received $6,000 from Merck's political action committee during his re-election campaign.

Texas allows parents to opt out of inoculations by filing an affidavit objecting to the vaccine on religious or philosophical reasons. Even with such provisions, however, conservative groups say such requirements interfere with parents' rights to make medical decisions for their children.

The federal government approved Gardasil in June, and a government advisory panel has recommended that all girls get the shots at 11 and 12, before they are likely to be sexually active.

The New Jersey-based drug company could generate billions in sales if Gardasil - at $360 for the three-shot regimen - were made mandatory across the country. Most insurance companies now cover the vaccine, which has been shown to have no serious side effects.

Merck spokeswoman Janet Skidmore would not say how much the company is spending on lobbyists or how much it has donated to Women in Government. Susan Crosby, the group's president, also declined to specify how much the drug company gave.

A top official from Merck's vaccine division sits on Women in Government's business council, and many of the bills around the

country have been introduced by members of Women in Government.

Morals For A Sane Society - It Is Now Time To Destroy The Lesbianists - Destroying The White House, Balitimore, Maryland, And Virginia, Killing The President Of The United States, Mr. George Walker Bush, Jr., And Sinking The Eastern Coastline Of The United States Into The Atlantic Ocean - Chaos Every Where In My Universe - Bringing An End To The Chaos In My Universe - Surrendering And Repentance - Lesbianists With Non Repenentant Attitudes Who Will Not Surrender - Orders To Kill All Presdential Candidates, Etc. - New Coins Ready And Are The Ever Useful To Us! - Public Nudity And Public Sexaling - What Does The New Moralicity Mean, In Plain Language? Sexaling Is An Absolute 'Good' And An Aboslute 'Right' - Free Action Sexaling Updated: 22-03-07 Rev.a. 00.b 09:40 PST

Morals For A Sane Society

To not fuck a person when you can fuck a person is a wicked act.

Not to fuck a man or a woman in the mouthal hole, or in the buttal hole, or to not fuck a woman in the vaginal hole, when you can, and when you are healthy, and when you have the time for it, by refusing, for what ever reason, other than mental illness, or 'gayist' reasons, you are committing a cheap and wicked act, when you refuse to fuck the other person, and use your dick, or your tounge to felate or kiss and tickle, and lick at the ladies' groinal area, and her vaginal cleavage, and vaginal flaps, or labial flaps, or labial tissue, and also her labial throes.

To not suckal a dick or a scrotum or tickle the males' groinal area, with your tounge, or with your fingers, and so forth, when you are able, and ready, and capable, is a cheap and wicked act, whether you are a woman or a man, girl or a boy.

You are given demerit points for not sexaling when you can and are able to sexal, and your time permits it.

To not participate in sexaling when you can participate in sexaling, is a wicked act. To prevent others from sexaling with you, or prevent a person from sexaling with you and your friends, these are both wicked acts.

A kindly and goodly person is a person who sexals all he or she can and who participates in sexaling with people, all he or she can, when ever he or she can to help those people, and one self, to erase the negative karmic markups each person has, and to help to create the wonderful energies that you can create by sexaling, and to change our universe into the nice place we need to change it into for us to live in, prospering with each other, in kindly loving embraces with each other.

If you stand or sit, talking, drinking, eating, with your clothes on, arguing, and discussing football, or baseball, or the local news on TV, or whatever, and you if you are not sexaling, as a result of your actions, when in fact, you could be sexaling, and helping to purify all the people around you, and yourself, as well, you are commiting an evil act, and an immoral act. It is immoral to behave in an uninterested manner, towards sexaling, and towards helping others by sexaling to purify their karmic markups. You are engaging in wicked, unkindly, and evil behavior, by non chalantly staring out the window, at a restaraunt, or in your car, with others around you, thinking about your miscellaneous thoughts, and by your not attempting to purify others, with every ounce of energy you have got, by sexaling with them, in a safe manner.

We do not want you to drive down the road, sexaling, and not paying attention to the traffic, and thereby causing accidents, and there be causeing harm and injury to self and to others, thereby preventing one self and others from their being able to freely mobilate, or move around freely, or ambulate, as they say in modern English, and then freely participate in sexalating activities of fucking, sucking, tounging, massaging the bodies, and the titties, and buttholes of women and girls, and massaging their kissing lips, and their vaginal lips, their facial cheeks, and their butt cheeks, and so forth. You must drive safely, and make it home, to a safe place, where you and your friends can freely sexalate with each other, without others interefereing with you.

A wicked or evil person is one who prevents a person from sexaling, and who destroys or ruins another person, physically, mentally, morally, emotionally, psychologically, or psychically, so that the other person can not participate freely and fully in holy and pure, GODLY sexaling activities.

This type of person who prevents others is a ruinous person, who will invite ruin and disaster to his or her doorsteps, and into his or her life.

There are many ruinous people, who execute others, and who torture, and cause pain, and suffering to others, and who disfigures others. These people who execute others, and who terminate their ability to sexal, prospering with others, making our universe into the kind of nice place we all want to be living in, together with each other, are wicked and evil people.

It Is Now Time To Destroy The Lesbianists

However, when we have a problem of the size and the magnitude of the Lesbianists, that we have, today, in this period of chaos, across my universe, and the Lesbianists' who are toying with humanity, and with all human beings who are not Lesbianists, it is time for us to take action, to prevent them from toying with us, and put a stop to their amusing themselves with their toying with us, any further, and it is now time to destroy them.

"I am Arjuna, a wickedly angry man, and I come to protect those who can not protect themselves. I will kill and thrust my sword and lance through the hearts of men and women who evilly try to prevent people from being prosperously good and bekindly to others."

This is a stanza or sentence from one of my writings, of old. 'Wickedly angry' in this sentence means, outraged, and furious, so much so, every one is scared and afraid of me.

I am 'wickedly angry' and I am here 'to destroy' those who would fuck us up, and ruin our lives, and make our lives miserable, as they toy with us.

My name is GOd, but in my Buddhist scriptures, I am referred to by many names. One of my many names, as I appear to people, in many and various personas, is Arjuna.

I have many sides to my character, as I am GOD, and I am here to protect my children, no matter what the name is people use to refer to me by, and that I am known by, and no matter how it is and no matter who it is among my many children, who I will protect from wicked and ruinous people.

Destroying The White House, Balitimore, Maryland, And Virginia, Killing The President Of The United States, Mr. George Walker Bush, Jr., And Sinking The Eastern Coastline Of The United States Into The Atlantic Ocean

There will not be any further Lesbianists living in Washington DC, or in Baltimore Maryland, or in Northern Virginia, and that vicinity, above ground, and below ground, if some one will be so kind as to place a very large explosives, fuels, chlorine, high heat burning metals fragments, and fracturable rocks bomb, outside the gates to the Washington DC White House, where the number one enemy, Mr. George Walker Bush, Jr., President of the United States, lives, and works, and then detonates that bomb, out side the gates of the White House, where the president lives, currently, and then destroys him, and his

White House, a lair for Lesbianists, with multitudes of torture rooms, i.e, lots of them, below and inside of the White House.

You will destroy and kill the President of the United States, Mr. George Walker Bush, Jr., and Mrs. Barbara Bush, Jr. and every one else who lives at 1600 Pennsylvania Ave. Washington DC.

Why are we going to throw all these people into my Epcot Center. Once in my Epcot Center, they can freely sexal with each other and they can earn merit points.

That will help them straighten out their karma, and it will help them to have a nicer life, when they are born as tummy babies. There are many tummy mommies who will match up with these people, and when they come out as tummy babies, they can start their life, with us, out here in my universe with us, again.

Am I a wicked wrongful person for terminating so many people's lifes? No. Why not? Because that is the only way we can over throw the vastly wicked and evil Lesbianists who practically rule my universe, with their perverse friends, and there are many groups of perverse friends, who we are going to get rid of, and send into my Epcot Center, one after another, as we move ahead, in our efforts to clean up our universe, and in our efforts to stop this nonsense of senseless killings and torturings of people, for amusement, and for game playing.

The Washington White House is one of the homes for these perverse people who game play and toy with all human beings who are not Lesbianists, who live on this planet.

We have many Lesbianists to trash, and to say good bye to, before we can begin to get our world, straightened out, and started up again, with a new culture, with new morals.

We will throw out their old cultures, their Lesbianistic cultures, and we will replace them with our new culture, and our new civilization, that is based on my religion, and on the sanctity of sexaling as a common sense value.

Sexaling is a sacred and holy act. Even if you sexal with a kangaroo, or a chimp, it is still a sacred and holy act.

Why is that? It is because every body is made of something, and that something comes from me, GOD. That something from me, is pure and holy, as I am pure and holy. I designed every person, and every animal, and every living being, with sexaling capabilities that allow that pure and holy GODLYNESS to come out once they begin sexaling.

That GODLYNESS begins to radiate out, as each person begins sexaing, and as each animal begins sexaling, and as each living being begins sexaling, eroteming, orgasming, and phlumetting, and it purifies each and every living being, and washes away the karmic markups every

person, and every animal, and every living being, has in them, and has stored in the molecules that are stacked up in my universe, out side the boundarary walls that hold this universe up, and that keep us in side of the area we are in, and that keep the rest of my universe standing up, stable, making this a safe place to live, at least, safe in so far as nothing comes crashing down on us.

My kids are expert builders, and it is thanks to them, that we have such a nice and safe, and well built universe to live in. It is also thanks to them, that we have these bodies to live in, and to sexal with, since my kids put us together, one molecule at a time, as we need to have our parts put together, along with all the anmials, and living beings, who are inside of us, that my children also assemble for me, and for us.

What is this GODLYNESS? It is a purifying force, that is of me, and is me. It is inside of every one, and inside of every creature, animal, and living being, in my creation.

This is woven into the fabric of your being, and it is of me, and is always a part of me, and is always connected to me. Since I am always pure, and GODLY, you have a possibility of becomeing pure, and holy, like me.

Right now, we are filthy, and grimey, and all gunked up, with sludge, and residues of our karmic heritage. We have done many things that contribute to who we are, and to what we experience, day to day, and if we are not happy with our life, that is because we have the karmic records and markups that dictate that we must be in this miserable and suffering condition, that we are in, today.

There is always sufferring, and unwholesomeness, in our lives, and around us, every day. There are many wicked things that go on, every day. People perpetrate wicked acts, daily, and they go on, unpunished, for a long time, until their karmic markups begin to add up to sufferings coming out, in that person's life.

Sufferings are your payback for your wicked acts, and they help to keep our universe in balance, as I've spoken about, a little, before.

It may seem unwholesome that I ask you to kill my kids, and put them into my Epcot Center, where they can sexal, and where they can get retrained, and where they can be taught to be nice people, after they are retrained, but my asking you to kill my kids, this is merely an expedient, or a means to an end, and it is permissable, given the circumstances, and given the situation, and given that we are at the begining of our new Age of Gurkian Englightenment.

The result we wish to see by killing them, is an end to the activities of the Lesbianists, and and end to the activities of other people like them, in my universe. The Lesbianists are ruining my universe, and ruining the lives of every body in my universe, and though this was the way things were balanced out, prior to now, we are starting out,

with a new method of 'payback' and a new means to balance out the karmic balance book. This is all to be governed by my rules and regulations, that my kids will enforce, in our new, Gurkian Age of Enlightenment, begining about now.

Our killing the Lesbianists, will help to control their ruinous and heinous behavior and activities, and it will help us to get them out of the picture for a while, until we are able to set up our new government, globally, or universal wide, across our universe, in a one universe government, over seeing the activities of all of my kids. It is the only way we have to begin to get our selves straightened out, and onto our new path, that we will follow, for the rest of eternity.

This marks the begining of the Gurkian Age of Engligtenment, and it marks the end of the previous period, or random, or just about nearly random, chaos.

We went through a very long period of decline, untill we got to the period of chaos that we are in, now. This period of chaos, we call, the 'melt down' period.

The 'melt down' period, came after the 'run amuck' period, when my kids began their severely ruinous activities that led to the period of chaos that we are now in.

Chaos Every Where In My Universe

We are going to begin to pull ourselves out of this period of chaos, with the help of my religion, and with our religious activities, and it is going to take us a very long time to pull ourselves out of it, as this 'chaos' is going on every where in my universe.

It will take us a long time to begin to be able to erase our karma enough, based on my religious principals, and the ethics of the Gurkian Age of Englightenment, and our religious activities of sexaling, dancing and excercising, and sexaling in syncopation with the metronome, at one thirty seventh and one fifth, or so, to then some day be able to have erased enough karma, to be rid of, completely, all these horribalistic people, my horribalistic kids, in my universe. When I say, be rid of them, I'm not saying, to trash them, completely. I am saying, we will put a stop to their activities, by changing our karma, and by purifying ourselves with my religion and our religious activities of sexaling, keeping time, in synch with my children, as we sexal, and as we activiate, playing basketball, tennis, or as we swim, or as we pray Nam Myeo Ho Ren Ge Kyeo, and so forth.

Bringing An End To The Chaos In My Universe

We are going to bring an end to the chaos, and to the chaotic behavior, and abberant, ruinous behavior in our universe, as we bring this period of chaos to a close. We will, as we steadily move forward, open the way for the budding and flowering of the Gurkian Age of

Enlightenment, and to the budding and flowering of the new age of friendship and loving care, among all of my children, who participate in my religious, social, economic, and karmic revolution, as we sexal with each other, lovingly, and strive to clearify and erase our karmic markups, sexaling, and synching our activities to one thirty seventh and one fifth on the metronome. Later we will fix our metronomes to keep exact pace in synch with my children, and after we fix and reset the timing scale of the metronome, the timing will be one thirty seventh, exactly, on the metronome.

Our sexaling will produce all types of wonderful, purifying energies, that will revive our universe, and that will revive us, and that will help us to reclaim our universe, and that will help us to live, prosperously, and prosperingly in our universe, together, with each other, and with every one of my children, as we reform the bad and naughty ones, who are wicked and unkind to others, and who prevent people from sexaling, together, with each other.

That means, we are going to kill all the bible thumpers, Pat Robertson, Orwell Roberts, Billy Grahm, Tammy Faye, Jim Faye, and all the other Lesbianists of every religious faction, or group, whether they are Lesbianists who are christians, islamists, judaists, shiites, hindus, buddhists, black moslems i.e., afro american black muslims, or whatever.

We are going to destroy them all, all who would try to prevent us from what we are attempting to accomplish, a global, universal wide, government, run by me, GOD/GOd, as I am the Captain of this ship, and then we are going to begin our new age of Enlightenment, hand in hand with each other, and when they come out of my Epcot Center, again, next time, to be born as tummy babies, to tummy mommies, and to tummy daddies, we will teach them the new rules, ethics, and morals of our new universal wide society, and then we will begin again with them, and raise them in accordance with the new rules, laws, regulations, ethics, and morals of our Gurkian Age of Enlightenment, led by me, GOD/GOd.

Surrendering And Repentance

Those who will surrender, will be allowed to be repentantent, and they will be forgiven for their misgiven, misbegotten, and ill minded ways, once they begin sexaling with the rest of us, and participating in our religious, economic, and social revolution, and once they begin following Gurkian laws, rules, ethics, the codes and norms of behavior, and our righteous, and correct morals, acting and exerting one's efforts for the sake of others, never sparing a moment of energies, wastefully on trivial and trite activities of gossipping, mischiefing, or other harmful, and potentially ruinous, wicked, and evil behavior.

Lesbianists With Non Repenentant Attitudes Who Will Not Surrender

Those who will not surrender, we will send to my Epcot Center, as that is the only way we can get them out of the picture, temporairily, so that we can then get things in order, before they return, once again, as tummy babies, into the lives of tummy mommies, and tummy daddies.

Orders To Kill All Presdential Candidates, Etc.

You are hereby authorized by me, GOD, John Francis Ayres, to kill all United States Presdential candidates, including but not limited to, Senator Barack Obama, Senator Hillary Rodham Clinton, Mitt Romney, Senator Christopher Dodd, John Edwards, Yesenia Emelina, Mike Gravel, Dennis Kucinich, Senator Joe Biden, Governor Bill Richardson, Wesley Clark, Al Sharpton, Al Gore, Tom Vilsack, Senator Sam Brownback, John H. Cox, Rudy Giuliani the famous World Trade Tower bomber planner / participant and bombs expert, Representative Duncan Hunter, Senator John McCain, Representative Ron Paul, Jim Gilmore, Mike Huckabee, Representative Tom Tancredo, Tommy Thompson, Newt Gingrich, Senator Chuck Hagel, Michael Savage, Fred Dalton Thompson, James Gilchrist, Elaine Brown, Ralph Nader, Steve Kubby, George Phillies, Christine Smith, Doug Stanhope, Kent McManigal, Gene Chapman, Barry Hess, Dave Hollist, and Robert Milnes.

They are all to be executed on sight. Also, you are ordered to kill all non repentent Lesbianists, such as, Vice President Dick Cheney, Tony Blair, Butros Gauley, Oliver North, Colin Powell, Oliver Poindexter, Casper Willard Weinberger, United States Supreme Court Chief Justice John Roberts, Associate Justices, John Paul Stevens, Anthony Kennedy, David Souter, Clarence Thomas, Ruth Bader Ginsburg, Stephen Breyer, Samuel Alito, Antonin Gregory Scalia, Arnold Swarzneggar, Sylvestor Stallone, Robert Deniro, Gary Busey, Kevin Sorbo, Timothy Dalton, Michael Jackson, Matt Damon, Bruce Willis, Mila Jovovich, Peter Jennings, all members of the United States Congress who are Lesbianists, and all other Lesbianists, whether in politics or not, and in whatever government you find them, around the world. There are many Lesbianists in local and metropolitan police departments, and in SWAT Team units, and in fire departments, and in the National Guard units throughout the United States, and Lesbianists own every news media organization, television corporation, cable television corporation, satelite television corporation, major radio station, transportation corporation, chemicals corporation, petroleum corporation, coal mining corporation, as well as every other major corporation around the world. You are to kill every last one of them, and spare no one. We will then destroy every underground city they are hiding in, and force them to surrender. If not, we will kill them all, and I authorize you to do exactly that, kill every last one of them, all thirteen billion plus Lesbianists, hiding under the surface of our planet, or out walking about, pretending to be an ordinary citizen on this planet. Nothing is further from the truth, and you are authorized to kill each and every one of them, and send them all to my Epcot Center, using what ever means available, including my tactical, powerful, home made radiological explosives bombs, i.e., nuclear explosives. Please study my notes on my web site for further details

regarding radiological fracturable rocks, and my notes on how to make an explosive weapon to detonate nuclear materials, you can find along beach shorelines, in sediments deposits, and on old mountains, every where on our planet, if you have a geiger counter.

New Coins Ready And Are The Ever Useful To Us!

http://money.aol.com/news/articles/_a/new-dollar-coins-enter-circulation-this/20070211095409990001?ncid=NWS00010000000001

"Updated:2007-02-11 15:20:31"
"New Dollar Coins Enter Circulation This Week"
"By WILL LESTER"
"AP"
"WASHINGTON (Feb. 11) - Maybe Susan B. Anthony and Sacagawea should not take public rejection personally. It's not easy overcoming people's indifference to dollar coins, even those honoring such historic figures."

See also,

http://news.yahoo.com/s/ap/20070211/ap_on_bi_ge/money_ap_poll

The new coins reportedly have many fracturable rocks in them, as the metals used, were mined from deposits of minerals that contain large amounts of fracturable rocks.

They also have high heats and high temperatures burning minerals in them, that will level up your thermal temperatures to near solar temperatures, if grinded up and mixed in, and allowed to ferment, in sour berry juices, slowly, with tiny amounts of salt, and large amounts of raw sugar.

The high heat temperatures, and the energies produced at these higher heat levels, will reach near solar heats energies temperatures, and that is very important for developing the energies needed to wake up every body, in the fracturable rocks - or 'fissile' materials, in Lesbianists' speak, or Lesbianists' mumbo jumbo language - to get them to begin making children and families.

Please see my notes on 'Radiological' crystals cages salts kiddies, and other related energical animals kiddies, of various, and hard to imagine, types, unless you're a kid and unless you have the mental flexibilities and typical mental gymnastics capabilities of a normal child, unhindered by brainwashed thinking and brainwashed patterns of thought the Lesbianists have caged, and closeted in the dark, our brains with.

Public Nudity And Public Sexaling

Public nudity and public sexaling is now a way of life for all, in our, now, Gurkian Age of Enlightenment. We will begin broadcasting live sexaling events, and other entertaining and informational, educational programming,, as soon as I get my new quarters, a unit to

live in, where I can eat more properly, sleep more properly, recieve the medical health aides and regroverative formulas, that I need, and where I can practice my religious ceremonies, with others, daily.

The public broadcasting of various informational programing, educational programing, sexaling entertainment programing, sexical, hygenical i.e., sexaling hygene, and sexical educational programing as well as sexical training programing, as well as my religious ceremonial sexaling activities, and my general, more typical day to day, religious ceremonialing, for now, until I get my health up to a level of youthful vigor, and robust wellness, as I religiously interact with my students, and train them, the disciple priestesses, and disciple priests, will all help to set the basis of normative, and expected, social behavior, for all people in our universe, to learn about, now in our Gurkian Age of Enlightenment, so that we can all get along, with one primary set of customs and standard of behavior, and with one primary language for communication, as we will all be sexaling with each other - all of my children who are now just begining to get with the program, at least, anyway, will be sexaling with each other - from now on, and for all eternity.

We need this exposure, as well as alternative programing, for laundering up to, and for begining to expose ourselves to, and learn about, the reality of the universe, my universe, that we live in.

Laundering up to, means, exposing ourselves to the mischievous antics of the Lesbianists, to launder their filthy, garbagical, and tormentuous ways, so that all may learn about them.

This will be coming up, in the near future, possibly, as far as I can determine, any way, after we have the spilling of the sexaling fluids campaign under way for purifying the area where I will be setting up my religious ministry, on the parcel of land, on the north west corner of the intersection at West Tropicana Ave. and South Decature Blud., Las Vegas, Nevada, and possibly on confiscated properties to the north, as well as to the west, for now. This is a public service, informational bulletin, on what you are to expect, in the near future. Prepare yourselves, accordingly.

What Does The New Moralicity Mean, In Plain Language?

Our new moralicity means we are going to learn we can and should sexal with every person, and even with animals, when we have a chance or opportunity to sexal with people and animals, and that we can and should sexal with every person we see, so long as we have a mutual reciprocical understanding of the truth to sexaling, that it is a pure, blessed, and holy act, GOD, me, made possible, to purify you of your blemishes. It is the most significant and powerful way to purify you of your blemishes and karma

You can also clearify your blemishes, your karmic markups, by praying Nam Myeo Ho Ren Ge Kyeo, and by your keeping syncopated and in rythm

with my children, helping my children to work smoothly, syncopated and in rythm with each other, perfectly fluxed, meshed perfectly with all my other children, working at different life spins, as I've mentioned about, as my kids will reward you by sprinkling faerie dusts, purifying energies, and other types of related, purifying things and dings, all over you, as a reward for your cooperation in keeping my universe, humming, and running, smoothly.

With your syncopated rythms, your syncopated pace of movement, and actions, as you time your motions, and stay in synch with one thirty seventh on the metronome, plus one fith of a mark on the metronome we currently have available to us, here, on our planet, during your activitiating, sexaling, playing sports, dancing, excercising, and so forth, you will purify your life, and you will purify the lives of those around you, with your actions, as you get rewarded by my children.

Our new moralicity means we can and should sexal with each and every person possible, in free association with each other, no matter what the age of the person, and no matter what the gender of the person, no matter what the tribal background is, no matter what the tribal heritage is, any place no matter where we are, any time no matter what the time of day or the time of night it is, in public spaces or in private living spaces any and all places, no matter who else is around us, as sexaling is a blessed act that my kids reward you for, any time, every time, no matter where you are sexaling, and no matter with who you are sexaling with, or even no matter what type of animal you are sexaling with.

It means there are no bullshit, propagandists' Lesbianists dreamed up taboos, any longer, regarding sexaling, and that sexaling is a blessed act, and not a 'forbidden' act, as the bullshit Lesbianistic Christians, Muslims, and other religious 'pious' bullshit assholes, who would want us to believe that sexaling is forbidden by 'God', which is complete and total bullshit, and a lie, as they base them selfs on their 'holier than thou' pious 'ignorance' of the truth.

So long as you and the person or persons you are with are equally, mutually, and reciprocally interested in purifying your lifes, and interested in clearifying your karmic markups, and interested in helping my children work in synch with each other, and interested in helping to push my children along, with your energies, and efforts, and so long as you can sexal together with one and each other, without damaging either or any of the participants, it is morally correct behavior, and any person or actions to prevent that morally correct behavior must be condemned, and punished.

Some people, especially young participants, do not have butt holes, mouthal holes, or vaginal holes that are large enough to swallow a dick, or mouthal holes that are large enough to swallow a tittie and suckle it fully, without straining.

You need to spend several hours phlooching out the butt hole, or phlooching out the mouthal hole and throat, and phlooching out the vaginal hole, with generous massage over several hours to the muscles and tendons in the neck, mouth, nose, eye ridges, ears, throat, face, chest, tummy, back, arms, hands, fingers, shoulders, titties, thighs, hips, waist, groinal area, labial folds, vaginal lips, facial lips, male genitals, and the entire torso, back and front, the legs and feet, ankles, and toes, as well, and all parts and areas from head to toes and in between, with continued efforts to massage all these places, until the body begins to respond, and until the body responds fully.

The butthole will loosen up, and the throat hole will loosen, and the mouthal hole will widen, and the vaginal cavity and vaginal mouth will widen and expand in size, and the groin in girls will spread apart, allowing for more room for access to the vagina, and for smoother access to the butthole, as the hips loosen up, and begin to spread apart in response to your efforts at massaging the body, to prepare it for sexaling.

No matter how old a girl is, and in the case of a boy, no matter how old the boy is, baby, child, adolescent, or adult, phlooching out the sexaling orifices, is easy, if you spend the needed time on preparatory and thorough massage, sufficiently enough.

That's how I designed your bodies to respond to massage efforts to loosen up the muscles, ligaments, sinews, cartiladges, so as to allow the bones of the body to move and spread apart, freely, and loosenly. Your body is like a rubber band, and if you massage it, well enough, it will begin to respond like a rubber band, and it will loosen up, and spread apart, where it needs to spread apart, so as to allow you to sexal, thoroughly, and continually, for as long as you continue your sexaling activities.

After you finish your sexaling activities, your body will begin to stiffen up, as all the ligaments, sinews, cartiladges, muscles, and fiberous threads throughout your body, begin to tighten up, for returning to daily life, working activities, where you need a hard, and tough body, to survive, as you work in the field, or work in the rice paddies, or work on the farms, to labor for producing crops for feeding you, your families, your children, relatives, tribal village friends and tribal villages neigbors, who are, or who used to be, traditionally, as life used to evolve for us, all related to all of those concerned in the area, or on the planet, for that matter, or in the entire galaxy, or spread out over many galaxies, and even spread out over even larger, and wider areas of my universe in the large, familiies that used to be the norm.

You may need to spend several hours, or even several days, or maybe even longer, a number of weeks, or even a number of months, before the body will begin to respond, and begin to flex, and bend, to help all the ligaments, sinews, cartiladges, tendons, muscles, and all the body parts, and supporting, interwoven parts of your bodies, as I've

briefly talked about, before, as well as all the lubing stations, that will eject fluids to assist in the loosening up of your bodies' ligaments, sinews, cartiladges, tendons, muscles, and even the bones, to allow them to be more flexible, including the jaw bones, facial bones, neck bones, spinal bones, leg bones, thigh bones, hips bones, pelvic bones, buttal bones, groinal bones, back bones, and all the bones of the body. Every bone in your body will loosen up, and become more flexible, and pliant, durile, durable and tensilely strong, as you massage all the parts of your body, and the bodies of the people you are sexaling with, very young, young, adolescent, adult, middle aged, elderly, and even the ancient, or the extremely very old.

This is the truth to this matter, and you can find out for your selves, if you try and see how your bodies respond, to daily, rigorous, continued massage, over various lengths or periods of time.

This is part of the ancient and old art of sexaling, as I taught in my religious teachings, in every religion that I taught, and I have taught a lot of religions in my time, to lots of different peoples in my universe, from the begining of our time, here, together, in our universe, after we arrived, which I've talked a little about, before.

Sexaling Is An Absolute 'Good' And An Aboslute 'Right'

Even the veryest oldest and the veryest youngest have a right, duty, and obligation to sexal and produce holy, sacred, sanctifying, i.e., to make sacred, holy, and pure, harmonious, purifying energies.

It is an 'A B S O L U T E' RIGHT as in, a 'right' to free speech.

It is also an 'A B S O L U T E' RIGHT as in, 'this is right, correct, upstanding, laudable, commendable, proven to be always right, correct, true, holy, graceful or GODlYNESS and GOODLYNESS gracefilled, morally right, morally correct, morally absolutely right, and morally absolutely correct', as opposed to, right and wrong, i.e., as in the opposite of wrong, as in, that is wrong, that is incorrect, evil, hateful, sinful, morally inaccurate, morally wrong, morally defunct, undoable as it will not stand, and useless,'.

It is also an 'A B S O L U T E' GOOD and an 'A B S O L U T E' GOODNESS.

Free Action Sexaling

Anything that counters, or runs contrary to this, is an 'A B S O L U T E' WRONG, and an 'A B S O L U T E' EVIL. It is absolutely wrongful to deny or to prohibit or to interfere with, in any way, with any one who wishes to sexal, as THAT PERSON IS CLEANING UP MY UNIVERSE WITH HIS DICK, OR WITH HER VAGINA, BUTT, AND TITTIES, AND WITH HIS PURIFYING ENERGIES, OR WITH HER PURIFYING ENERGIES! DO YOU UNDERSTAND THAT?

Any body who even attempts to impede, to deny, to prevent, or to interfere with, in any way at all, with a person's absolute right to sexal runs counter to Gurkian laws, regulations, codes, ethics, morals, standards, and you will serve jail or prison time, for prohibiting, or interfering, or impeding, or violating in any way, a person's absolute right to free action sexaling, which is, the act of freely chooseing who one wishes to sexal with. DO YOU UNDERSTAND THAT, SOLDIER? GOOD! BECAUSE A "NO SIR!" WOULD BE INAPPROPRITATE AND UNACCEPTABLE!

To learn more on these subjects, swear in, and become a citizen of our country, and begin studying, and working in the many programs my children have for you to study and work in, to score earning points, and to earn a living in our new, Gurkian Age of Enligtenment, where and now that we work, and we pay as we go.

Those who refuse to work, in time, will be required to work, to pay off their debts and to pay off the fees that are owed for the use of my resources, all the molecules in my universe, and all the resources, energical, or otherwise.

Even though I am GOD, in our new system of working in my Gurkian Age of Enlightenment, even I have to pay for the resources that I use, as I work as chief priest of my religion, spiritual director of my universe, and boss of my universe.

I'm the mother and father, the creator of all humans, animals, and living beings, as I've explained, every thing in my creation, and people will begin to understand that, that I am GOD, as they practice my religion, over the years, and over the aeons, and over the millenias.

The people who refuse to work, will be required to work in prisons, sexaling with animals, to produce sexaling energies that will restore the supplies of energies in our universe, as I've mentioned about, before, as they work and learn their new trade of animal husbandry, and animal wifery, in the animal habitry industry, as I've also mentioned about, in earlier notes.

No matter what the age of the person, every person can participate in our Gurkian Age Of Enlightenment, sexaling, dancing, excercising, and syncopating their movements, in rythm, to assist my kids as my kids, work to keep my universe, strong, durile, flexible, safe, and a nice place for every one to live in.

DO YOU UNDERSTAND THAT? YOU HAD BETTER, AS A "NO SIR!" WOULD BE UNACCEPTABLE, SOLDIER! DO YOU HEAR ME? I HOPE YOU DO! NOW, GET TO WORK AND SEXAL TILL YOU DROP, SOLDIER, AND I'M NOT JOKING!

We will build a nice and comfortable, safe place for every one to live, now, in my universe, and we will follow the Gurkian Age of Enlightenment Rules and Regulations, Codes, Morals, Ethics, and behavioral norms, that you are required to live by, now that we are going to become, one, very big, happy, harmonious, in synch,

prospering family.

You will not forget to wash out your butty butt holes, and to flush out your vaginas, and your mouths, and to practice proper and health promoting sexaling and love making hygene, with the medical formulas that my children will be providing to you, and that you will pay for, out of your earnings, and they are very reasonably priced, now that I am making every thing available to every one, at a set, yet, flexible, and low cost for the use of my resources, once you citizenize your selfs, and swear in, as a citizen of our new, global, i.e., universal wide, one universe, family of GOD's, that's me, children.

The costs are flexible, in the sense that you do not have to pay, yet, as you will be learning about the ways to work, and you will be learing and preparing your selfs for a new working life, in my universe, for some time, and so we have no hurry to have you pay for the resources you use. We can collect the fees, and costs for resources, in the future, when you are a big money earner, once you learn your new work requirements, for sexaling for a living, as that is the only job opportunity open to every one, and the only job opportunity, that you have a choice about.

My working children, though they do have many different jobs, they have basically the same set up, or arrangements as you now will have, and so you will be joining my children, and you will be working, i.e., sexaling, excercising, aerobically dancing, and so forth, in synch, and in rythm, for me, just as all of my children are doing, at least, those of my children who are able to work, and who are bright and intelligent enough to work for me, to keep my universe, healthy, safe, solid, durile, strong, wholesome, and a nice place to live in.

That means, I have a lot of burnouts kids, and rampant, vagarous, dangerous children, who are not really very bright, and they do not work for me, yet, but they will, in time, regardless of the fact that they may at the present, be abominants kids, or not.

As I've mentioned, all my up until now, non working children, are abominants. What does that mean? It means, they do not give a darn about killing another person. They kill for selfish reasons, and for fun and games, and so forth, and you are all guilty of that, though you may not remember that you killed for fun and games, and for selfish reasons, in previous lifes, in my universe, but you all have, and you are all abominants, of varying degrees.

So, welcome to the Gurkian Age of Enlightenment, and welcome to my workforce.

Captain Off The Bridge.

FOR SALE: RADIO RECEIVING SET AN/GRR-5

JAN DESIGNATION: AN/GRR-5
NOMENCLATURE: RADIO RECEIVING SET
CONSISTS OF:
CABINET, ELECTRICAL EQUIPMENT CY-615/URR (1)
RECEIVER, RADIO R-174/URR (1)
POWER SUPPLY PP-308/URR (1)
FREQUENCY RANGE: 1.5 - 18 MHZ
MODES: AM, CW, MCW
OPERATING POWER: 6 OR 12 OR 24 VDC OR 120 VAC 60~ 1&#65533;
POWER CABLE PROVIDED: 120 VAC 60~ 1&#65533;
ANTENNA PROVIDED: 4 THREADED MAST SECTIONS
OTHER THINGS PROVIDED: TM 11-5820-284-15,
ORGANIZATIONAL, DS, GS AND DEPOT MAINTENANCE MANUAL;
SPARE POWER SUPPLY PP-308/URR
REMARKS: I USED THIS RECEIVER FOR YEARS. UNFORTUNATELY,
IT NO LONGER FITS INTO MY OPERATING PROFILE AND IS
EXCESS TO MY NEEDS. OVER THE YEARS I ROBBED A VIBRATOR
FROM THE SPARE POWER SUPPLY AND AT THIS POINT THE
RECEIVER PROBABLY NEEDS A NEW TUBE OR TWO BUT THE
EQUIPMENT IS OTHERWISE COMPLETE WITHOUT CATASTROPHIC
FAILURE FOR THE TIME I HAVE OWNED IT WHICH HAS BEEN A
BUNCH OF YEARS. PRESENT OPERATING CONDITION UNKNOWN;
SOLD AS-IS.
PRICE: $75.00
PAY BY: CASH OR POSTAL MONEY ORDER
DELIVERY: BUYER PICK UP IN SAINT MARY'S COUNTY, MD
RETURNS: NO RETURNS ON THIS ITEM
CONTACT: BOB CARTER, W5BTC
EMAIL: dc2light[at]md[dot]metrocast[dot]net

Ever try beer bottles? Both 655 ML (howitzer) and 750 ML (mortar).
Better effect because of shrapnel.

Maybe a good idea. Like everything else in Texas, I would expect the
lesbianist to be big, with big hair. With a 750 ML rounds, I'm afraid
I might fall asleep before I got the first round emptied, though.
A Texas lesbianist:

>> A friend is looking for the power connectors for the WW2 TCS receiver.
>> Anyone got some in their junk box?
>Wm Perry Co. has them, normally, for about $22-$25, each.

WOW! Maybe I oughta offer to sell (some of) mine! I have:
3 original boxes (of 2 each, NOS) of the 12-pin connectors,
1 loose one,
1 each on my 2 TCS-13 receivers, and
1 on my power supply!

I also have :
3 original boxes (of 2 each, NOS) of the 16-pin connectors,
1 loose one, plus
1 each on my 2 TCS-13 transmitters,
1 on my power supply!

At a nominal $20 per NOS and, say, $10 per non-NOS ones, I could
buy a (used) non-boatanchor rig and lightening my operating table
by 200+ pounds! And my junque box wouldn't be so full, either.

But what if I wanted to use some of my (NOS) boxes of TCS cables?

Nah, I'd better keep them; s/he who dies with the most toys wins!

I have an almost new GRC-9Y or more correctly described, a GRC-87 radio set. If you have the GRC-87 or VRC-34 book, its virtually everything in Figure 1 EXCEPT the receiver DC cable. That is to say, it includes the RT-77A (US Mfg), DY-88 DC supply, PP-327A A.C. supply, GN-58A generator (w/ new style regulator),legs and seat, 2 interconnect cables, mic, headset, key, speaker, spares set, extra 2E22's, antennas and counterpoise, antenna bag, guy set, vehicle mount, canvas cover for R/T unit, ME-61 field strength meter, all TM's, etc. Depot replaceable bias battery kit installed in receiver so no more scarce battery. Currently on the air. Minimum offer is $950. Prefer pick-up in MD.

Source record: 8372

well, i know how to do this now and save the knob. you remove the transmission cap covering the tuning gears. with this out of the way, there is room to then access the back of the dialknob w/long shanked thin blade screwdriver. the hole in the faceplate is big enough to reveal the ports in the back of the dial knob assbly. the screws holding the black knob to the skirt will appear in little 'windows' as the dial is rotated. remove as they appear until all 3 are out, and black knob will come off. a magnet helps w/retrieval. you now have access to the front of the shaft.

instead of trying to wiggle or add solvents from the front, i took a flat tipped punch and very gently tapped on the back of the dial, which since the transmission cap is off, you can now also see/access. tapping was on the thick buching part of of the dial, right at the shaft. knob pops right off. you could work carefully tapping around the knob base while rotating the shaft i guess, if it was stuck badly.

i think it was stiction holding it -- shaft goo was completely liquid and there were no dings on the shaft. yet knob wouldn't just slip off.

That is the key. If you don't have it, you can work back from the S-meter
and trace it, but the manual will make your life much better.

>The S-Meter is functioning, but still, I realize that this doesn't tell the
>whole story. I am expecting to see a shorted AGC timing capacitor.

Maybe, but again the S-meter should be after the time constants of the
AGC circuit. But at least you know something good is coming out of the
detector.

> Once I get the schematic, it will be a little bit easier to muddle through
>the circuit. For the time being, I am stuck.

Put it on the shelf until the manual arrives. If you fix it now, when
you get the manual you'll hit yourself on the head and wish you had waited
for the manual to arrive because it would have been so much easier.

i have a couple of 'cap packages' that are stuffed w/wax -- or
whatever the brown goo is-- like the kind used to seal slugs in tuned
coils.

one is a bakelite case, the other a metal box, both w/the caps and
leads buried in the goo, which seals the bottom of each case. the
metal box one is a cornell-dubilier.

is there an easy to remove the goo -- maybe by melting it out? want
to see the innards clearly before pulling the caps so i can rebuild
correctly. cap values are known -- mostly a matter of seeing how the
leads connect and how insulated from the case for the metal one.

I use a heat gun and patience, but others who restore vintage
radios set the case or box suspended above a pan in the oven at
about 200 or so degrees F, and wait an hour or two. If Mrs. is out
of town when you do it, that's a good thing ;>)

Thanks Scott,

I did receive the manual today. This receiver uses an AGC diode in each of the I.F. amplifiers, similar to the way that it was done in the Collins 651S-1. No wonder this rig has such a good dynamic range. These older designs used high Q transformers in the I.F. strip. The newer KR-85 units have what seems to be lower Q Toko units.Still, the KR-85 is a pretty good receiver. I do like these T12 series much better, though.
It looks like there is a 2.2uF electrolytic cap that acts as a low-pass filter after the AGC rectifier. I think that if I figure the
T-12C radio out, I will be able to repair the T-12B. If I had something like this years back, I would have never bothered to learn how to design receivers.....maybe that was a good thing!

1235. FT243 Crystal Sockets?

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-04-03 09:16:38 UTC
From: Theo <theodore.twyler@ntlworld.com>
Message-ID: <WXoQh.1853$x4.952@newsfe4-gui.ntli.net>
Source record: 8381

Can anyone suggest where I could obtain a couple of
FT243 crystal sockets?
Any assistance would be greatly appreciated.

Hi Jack...

Any particular model? I have a fairly nice S-40A that I went
through. recapped, etc.

And if any one of those stages fails, the system will still work with only slightly degraded AGC, unless somehow one of those diodes fails into a short and pulls down the AGC line. This is something fairly easy to try.

>It looks like there is a 2.2uF electrolytic cap that acts as a low-pass

Where is the meter there? If the cap fails into a short, will the meter still work? If so, it's not that cap.

ICM should have some in stock.

In a pinch, you can make an improvised one with two RCA jacks.

An octal socket will hold two FT243 rocks, if you have the real-estate
for it.

I _SWEAR_ the sigmonster pulled the .sig out all by itself. I have had
my suspicions about it having become sentient, but *this* clinches it.

"International Crystal Manufacturer", though perhaps they've actually
changed the name to "ICM" by now. A long existing crystal manufacturer
in the US.

There must be an equivalent company over there that manufactures crystals,
and hopefully still deals in small quantities, but just as you've not heard
of ICM, I don't have a clue what businesses in the UK or even Europe do
that sort of thing.

AB-

One common material used was beeswax, which is a beige or brownish wax.
Paraffin should work equally well, but is clear or frosty-white in color.

The meter comes after the AGC transistor. The AGC circuit consists of a germanium detector diode with a low-pass filter that feeds a DC amplifier. The amplified DC voltage controls the gain of the 3 I.F. stages and the RF amplifier. It is almost impossible to get at the RF amplifier and the mixer. These devices are embedded in the bandswitch assembly, along with two of the AGC diodes. Now, if one of those diodes is cracked, that could also cause a problem.
One of these days, I will dig into the radio. I've got a good T-12B and T-12C, so at least I have a couple of reference standards.

Can you get into the switch assembly well enough to use a DMM with
a diode test function? An open germanium diode is definitely a prime
suspect. If you find an open one, you can just solder a replacement one
in parallel, since a little extra shunt capacitance won't hurt in this
case and it will prevent having to do further disassembly.

I think your making a lot of work out of it. Simply heat the
outside of the can with a heatgun, and when the adhesion to
shell weakens you should be able to slide the inner assembly
out. There is absolutely no need to replace the old wax or
tar with new material once a new capacitor bank is assembled
and put into the can.

I finally figured this one out.....it was the AGC amp transistor.
Unfortunately, it is an NPN germanium device, but just as an experiment I
tried a silicon device. No more overloading, but I will try to find some
germanium replacements.

The HE-10/KT-200 was my first "ham receiver" back in the
early 60s. I'd rate it one step above the S-40, but that isn't
saying a whole lot :) I finally located a KT-200 after a few
years of searching for one to relive my novice year. Alas,
the chase far out did owning one.

That is interesting. Are both single conversion? I know that the
HE-10 has IF Gain control and ANL, it is pretty sensitive and
selective on the BCB.

They are both single conversion. I know the HE-10 has two
IF stages, and thus fairly good selectivity. I am not sure
if the S-40 has one or two IF stages... I suspect one.

The S-40 series has two IF and on RF stage. Single RF
receivers with 455khz IF's tend to have image problems on
the higher bands but that also depends on the selectivity of
the RF stage. Keep in mind that nearly all Hallicrafters
stuff was designed to be sold at relatively low prices. For
the most part the line has good features and outstanding
looks but not the best performance in the world. The point
is that someone could afford something by Hallicrafters when
other stuff was just too expensive.
I have somewhere in storage a military technical manual
on communication that shows performance graphs for the SX-28
and the Super-Pro, the differences in image and spurious
responses is astonishing. The Super-Pro is nearly free of
them, the SX-28 graphs look like corn fields. However, the
commercial version of the SX-28 was around $225 and the
Super Pro about double that.

> for it.

In my younger days I made them from old octal sockets.

What I did was to select an old molded *BAKELITE* octal
socket that still had two or four good contacts properly spaced
(alternate pins). Sockets with damaged or missing mounting rings were
preferred. With luck and care you can get two xtal sockets from one
octal.

Then I'd remove the mounting ring and cut the bakelite piece in half
so that I had a piece with two contacts and the pin hole betwen them.
The hole between would then be drilled through for a 4-40 mounting
screw.

Then I would clean up the rough edges with various flat files. (I had
a lot of time and energy in those days).

End result is an FT-243 socket as good as any bakelite one you could
buy.

--

Another trick is:

1) Use an intact octal socket
2) Wire pins 1, 2, 5 and 6 together for one side of the circuit
3) Wire pins 3, 4, 7 and 8 together for other side of the circuit

Wired that way, you can plug an FT-243 in any way it will fit properly
and it will work.

73 de Jim, N2EY

I think I shall make one just for the heck of it.

It's age, and never having had a COllins, I can never remember which came
first.

But, the reason people differentiate is becasue the change of the emblem
is an easy way of determining when the unit was built, and there are
minor design changes that came with the emblem changeover. Again I
can't remember details, but it's on the level of one has plug-in relays
and the other doesn't.

People do not desire Collins equipment with certain types of emblems,
they desire the version of the equipment that comes with the specific
emblem.

This has come up before, and I know the differences were defined the
last time the question came out, which must have been within the
past two years, if that far back. Doing a search of the newsgroup
archives at google should reveal the last time this came up, and
the internal differences.

Not true! The plugin relays were very early in the S-line, and were
gone long before the round emblem.
>
> People do not desire Collins equipment with certain types of emblems,

Also not true. The later winged emblem models had the same upgrades
as the round emblem.

It is purely a want for the youngest of the units.

I have sold all my Drake TR7s except one that I was planning on keeping. However, I have decided to sell it. I just don't use it. It is a late SN TR7 Transceiver with Noise Blanker and all filters but the narrow CW filter. It has the Drake PS7 Power Supply and the MS7 Speaker as well as the Drake 7077 Desk Mic. I also beliver that I have the original box for the transceiver. Included is the original manual and a W7FG copy of the service manual. The Transceiver has very litte use on it and and looks and operates as new. I am asking $850 for the complete station. I don't believe that you will find a nicer one. Let me know if interested and I can send some digital pictures. Thanks, Charlie Hugg, K5MBX

Many years ago my father (now a silent key) built a crystal tester that pretty much worked with any crystal you stuck into it. Low frequency, high frequency, name it. It also had a meter that indicated "crystal activity" and also had an adjustment (think it was a pot) for IIRC "bias". Also an output jack to feed say a frequency counter.

I imagine that he got the circuit from either an issue of QST or the handbook. Searched the web, though I found many circuits, none looked like this one. Anyone recognize from my sketchy description the circuit my father used, and any links to where I can get a schematic so I can build my own? TIA

Apparently -- age when they were made

For what it is worth see The evolution of the Collins emblem URL:

http://k9ham.cargodog.net/collins.htm

And for further research -- it sez: For more information on the Round
Emblem transition, please see the 1998 March/April issue of the Collins
Journal.

To check crystals I use an old Heathkit Grid dip oscillator. good
xtal will oscillate, meter will show activity ,tune it in on your
receiver to read frequency. Don`t think the newer GDO (fet osc) will
work as well as the old tube type..I see them at hamfest ,sometimesf
or or a few bucks..GL HS

Pierce oscillator circuit will do what you want, and you should
find it in some editions of the Handbook. I know Hints and Kinks had
an updated version using a MOSFET, but to be honest anything with a high
impedance input and some gain will oscillate that way.

As Scott said, any amplifier with gain can be used. Generally, oscillators do not work over infinite frequency range. If you wanted to check out the low frequency surplus crystals, you built one with a lot more inductance in the "plate" lead. Most hf crystals will check out fine in a single oscillator.

I have built some using an fet for gain and a led to indicate current flow. Although I have some with meters, generally you are looking for a go / no-go type of indication. Heath grid dip meter works well, but you need to build a socket adapter.

I built a single fet gate dip meter using an MPF-102 out of the Handbook. I used an FT-243 crystal socket for the coil. It works great as a crystal tester and the meter indicates activity. Great to let me know I have a dirty crystal. Although it does not work on low frequency crystals, it works well otherwise.

My favorite is one from Ham Radio. It was a solid state oscillator with an isolating amp for the counter. It has a built in switched capacitors for change crystal loads and if you plug in an inductor, it will read out in inductance. I made adapters for various types of crystal sockets.

It reads overtone crystals quite well.

The big problem is sorting out the drawers full of crystals. The mathematical odds that you will have and can find just the crystal you need decreases as the number of crystals increases.

AR88 LF Overhauled a few years ago by the late Jack Parfoot near Toronto Ontario Canada. Has been sitting in storage since. This radio is in beautiful condition with the correct rare s-meter.

$750 obo local pickup preferred unless buyer pays for company to crate. One of the nicer ar88's i've seen. Even the chrome strips shine beautifully. A proud addition to a serious collectors shack. Will be on ebay next if not sold on the NG

email only.

Bob

A simple Pierce or a Colpitts osc. would do the trick. The oscillator
will only work in the fundamental mode. I suspect they
built a simple oscillator, and probably added a germanium
diode (detector) on the output to drive a meter to indicate
the relative "activity" of the crystal under test. I checked
my Bill Orr handbooks and didn't find anything similar.

For sale: Very rare German WWII medium/shortwave receiver M.W.E.c
(Caesar).
This radio was used by German command tanks. Very sophisticated radio,
which covers 830 to 3000 kHz in 2 bands. Made by Telefunken in 1940.
9 tubes RV12P2000 (spare tubes available), double quartz filter
variable bandwidth, magnesium alloy (lightweight type, very rare !)
about 12.5" by 8" by 7" ,15 lbs. This radio is in very good cosmetic
and very good working condition. The radio comes together with home
made power supply and original power supply cable. $2700. Will ship
continental US only.

Ken, I have the book for the PP-327A, virtually identical (I'm told) to the "B" model. The 50-page manual number I have is a Signal Corps special manual, Signal Corps 27188-PHILA-52, with addenda. Its the manual for the power supply, not a prelim or anything like that. Let me know what specifics you need in addition to the schematic and I'll see what I can do. BTW, the 1.5v and 6v ballasted regulators can easily be replaced by a couple of Fairchild regulators made for those specific voltages. It makes life easy!!!

Chuck, I have an original manual for the RT-18A/ARC-1 that I liberated from the trash can at Page Airways in the mid-60's. I also have the Aerocom multi-channel modification package that was stuck inside it. Its a big book with a multitude of fold-outs. Mine is also in delicate condition, although not as bad as the dead sea scrolls, of course, but its been around the bench, obviously. If there's something specific I could help you with, I'd be glad to do what I can. I guess I should have made master copies of a lot of manuals I have before I retired and lost the facility to do so....hi!!! FYI, the book doesn't have a TM, etc. designation. Its obviously WWII vintage as it mentions the Navy, the AAF, and the British Air Ministry. The preamble makes it appear to be a factory book. The heavy, reddish-brown binder looks typical Navy from the period? Wish I still had the original ARC-1 I had back then!!

Hi Jeep,

I don't yet know if my ARC-1 has any problems. I just like to have the documentation so I can avoid making any new problems. I do have a poor copy of the schematic, so I could hook it up... but I probably will wait until I have a depot manual.

-Chuck

OBTW, we have actually met at a few different swap meets through someone who's initials are TB.

have an 'audio filter' package that sits between the output of 1rst
audio 6c5 and a tone control. shot; needs rebuilt. 1940 national.

am looking at mouser for suitable chokes. there are waaaay too many
choices... vintage electronics did not have any suitable....

what is best generic part for this application? ie i need to narrow
down 100's they offer to what i need in some way. was looking at
fastron epoxy mcc/n series. can't find the exact values, either. can
get w/in 20-30 MH. how critical?

schemo gives two 'filters' (choke/inductor) valued at 175MH and
360MH. also in the package are two mica caps .006mfd and .011mfd.

the values seem hard to find for micas -- is 'orange dip' substitution
for this ok? i can turn up these micas up on mouser but at $6-25 (!)
each, depending on specs.
thx much all help.

Not very, though it will change the filter frequencies by a little bit.
They aren't super sharp, though.

How did the inductors fail, though? They hardly ever do, unless a cap
fails and throws DC on them.

>schemo gives two 'filters' (choke/inductor) valued at 175MH and
>360MH. also in the package are two mica caps .006mfd and .011mfd.

Miller makes some inductors in that range that Digi-Key stocks. If you
want to be right on, get larger ones than you need and take off winds
until the value is correct. Higher current inductors are easy to do this
with.

>the values seem hard to find for micas -- is 'orange dip' substitution
>for this ok? i can turn up these micas up on mouser but at $6-25 (!)
>each, depending on specs.

Yes, but again, mica caps don't fail easily.

What makes you think these are bad?

But in the old days, there wasn't much choice but mica capacitors for
precision capacitors.

Likely things have improved, though I don't know if the other choices
are less expensive. Things like polystyrene capacitors have come
along in recent decades, and that sort of thing may be the place
to look.

What you don't want is a capacitor that has really large variation
between capacitors of the same nominal value, or likely capacitors
that change a lot with temperature.

Are the caps specified as mica in the parts list?
There were actually two kinds of mica caps, one was the
familiar silvered mica where the "plates" of the capacitor
are plated onto the mica dielectric and the "stacked" mica
using foil. The former are the familiar very stable type the
latter were not so stable but could be made for relatively
high voltages. I suspect these are of the latter variety and
modern metalized plastic caps are better and more reliable.
BTW, despite reputation for high reliability of
silvered mica caps the older molded body type seem to fail
at fairly high rates. I just went through restoring an

SP-600-JX 17 which was in very good condition but have had
to replace at least half a dozen or more silver mica caps
because of instability. This is not to say they were bad,
after all, they are more than fifty years old.
You may be able to salvage the inductors depending on
what has happened to them. If the leads broke of the
terminals you may be able to simply resolder them. Its
certainly worth a try.

This comming Sunday...

+++ Now even more Buyers Parking !!!
Thanks to Shire we have use of their new parking lot
across Albany St from the SWAPFEST !!!

!! ** More Buyers PARKING is available ** for details see
http://web.mit.edu/w1gsl/Public/flyer

*** !!!! In our Traditional GARAGE and the adjacent lot !!!! ****
so come rain or shine or super heat the Flea is on !!!

********* $1 buyers discount with hardcopy of this notice ********

COMPUTERS - ELECTRONICS - HAM RADIO - COMPUTERS - ELECTRONICS - HAM RADIO

FLEA all SUMMER at MIT
Sunday April 15th 2007
9AM-2PM

Come to the city for a great flea - plenty of free parking.

MIT's electronics and ham radio flea will take
place on the third Sunday of each month this summer,
April thru October.

There is tailgate space for over 600 sellers and
free, off-street parking for >2000 cars!

Buyers admission is $5 (you get $1 off if
you're lucky enough to have a copy of our ad)
and sellers spaces are $20 for the first and
$15 for each additional at the gate.

The flea will be held at the corner of Albany and
Main streets in Cambridge; right in the Kendall
Square area from 9AM to 2PM, with sellers set-up
time starting at 7AM.

SEASON PASS + Advance Seller Discount

A sellers discount season pass is available which
offers a 30% discount. By prepaying you get a
discount and earlier admission. See the registration form.

*** Attention Sellers ***
Prepaid vendors.. Season Pass or monthly,

will be admitted FIRST.
Separate lines will form prior to gate opening
for prepaid and nonprepaid vendors

!! RAIN or SHINE !! Have no fear of rain, a covered
well illuminated tailgate area is available for all
sellers (6'8" clearance).

Talk-in: 145.23- (PL 88.5) W1BOS/R and
W1XM/R-449.725/444.725 (PL 114.8/2A).

Sponsors: MIT Electronics Research Society
MIT UHF Repeater Association (W1XM)
MIT Radio Society (W1MX)
Harvard Wireless Club (W1AF)

For more info / advanced reservations 617 253 3776

********** $1 buyers discount with hard copy of this notice ***********

<<<<<<<<<<<<<<<<<<<<<<< cut here >>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>>

Mail the coupon below by the 5th of the month to be a Prepaid Vendor.

FLEA at MIT 2007 Rates

SELLERS

To use your prepaid spaces the named vendor MUST be present.
Rates include one admission per space.

Advance $17 First space
$12 Additional Spaces
Must be received by the 5th of the month.

Gate Admission $20 First Space
$15 Additional Spaces
Admission is after the prepaid vendors

Early Bird Buyer -Admission after the prepaid vendor line is admitted. ~ 7:15AM

Source record: 8263

I have for sale a Kenwood TM-732A Dual Band 2/440 Mobile Transceiver. It is in very nice cosmetic condition and receives well, but needs the dial lights and the
final transistors replaced. It puts out some power on both bands. I am able to bring up the local 2 meter and 440 repeaters, but it does not put out high power.
It comes with the matching Kenwood Mic, Mobile Mount, Power Cord, and Manual. Price is $125. Thanks, Charlie Hugg, K5MBX

Those of you who have attended the MIT flea market(s) in the past...

I am told that the MIT flea market is almost all computer gear and other electronic gear (e.g. lab equipment) and very little ham radio gear. On average is this true or false?

I have a bit of a phobia about driving into Boston, haven't done it for years and am not looking forward to the next time, so I'd like to find out more about it before I attempt to make the trip...

Several years ago I heard the same comment from a co-worker, W1KSZ, who lives in Lexington, Massachusetts. If you contact me directly I'll email you his email address offlist so you can contact him directly.

If you are looking for a 'ham' flea market, NEARfest at the Deerfield Fair Grounds in Deerfield, NH on the first weekend in May [4th & 5th] may meet your needs.

Good morning, Dave.

Thanks, and say hi to Richard for me... I remember him from the old Heavy Hitters days back in the 1970's and 1980's. He might remember me... WA1RKT (email is callsign at arrl dot net).

Yeah, you have no idea how upset I was when Hosstraders was kind of summarily canceled. I was glad to hear about NEARfest. I plan to be there.

Yes, but this is sadly true of almost all hamfests these days. There is
far too much computer gear, and most of it isn't old and interesting computer
gear either.

Still, if you are looking for components and parts or stuff to be scrapped
for same, it's worth the trip.

>I have a bit of a phobia about driving into Boston, haven't done it for

Where do you live? Can you rope someone into carpooling with you.
--scott

I'm looking for broken video projectors just so I can figure out how those
Ushio sealed arclamp systems work. Also, I am looking for the old RCA
HB-3 tube handbook (the SECOND receiving tube volume and the first transmitting
tube volume). Places like the MIT Flea are great for that, even if you won't
find an R-390 there.

The complete RCA HB-3 manual is online at
http://www.pmillett.com/hb-3_tube_manual.htm

Specifically the charts for the 6146 are at
http://www.pmillett.com/tubedata/HB-3/Transmitting_Tubes/6146-B_8298-A.pdf

This is the most wonderful tube reference ever produced, by the way, and
the folks responsible for getting it on the net deserve congratulations.

FWIW, I worked for Hewlett-Packard a great many years
ago in a factory repair facility. We routinely washed entire
instruments using a mild solition of dishwashing detergent
in water. This was sprayed using a paint spray gun. After
washing the chassis was rinsed off using plain water and
then blown out with compressed air. Then it was baked in an
electric oven running at about 130F for a minumum of 48
hours. I usually left stuff in for a longer time. I don't
remember any more if we had any kind of brush but I suspect
we did.

Before washing certain parts were removed. This
included meters, rubber stuff (because of the heat) and
hermetically sealed transformers and inductors. The reason
for the latter was that if the transformer did not have a
perfect seal (and many did not) some moisture would get in
and wouldn't bake out causing short. This was a long time
ago but I don't remember that any instruments were not
washable. Note that the detergent is the kind for hand
washing, not dishwasher detergent.
At least some of these instruments had ferrite core
inductors. I don't rememeber any difficulty with these but
would be careful nonetheless because there are many kinds of
ferrites and some may not like getting wet.
Most of the spray on cleaners appear to be about the
same as the "streak free" type glass cleaners using butyl
alcohol. While this is safe on many materials it _will_
attack certain plastics so I avoid it for anything but
glass.

Some TX and sweep tubes FS. Most of these tubes came from a TV repair shop at which the owner recently retired and closed up shop. The others came from an electronic repair shop which closed, and sold off their parts inventory many years ago.

5763 - NOS, RCA in original boxes. 4 available. $10.00 ea.

6146B - 8 available, NOS; two labelled as Sylvania, 5 as Hytron, 1 as RCA. In original boxes. $25 each.

6JB6 - (General Electric)- NOS; labelled as International Servicemaster, but have characteristic GE "dot matrix pattern" labeling. In original ICC blue-boxes. 12 available. $25.00 each.

6JN6 - (GE) Same as above- tubes are NOS GE in ICC boxes with ICC labels. 4 available. $10.00 each.

6KN6 - Same as above- NOS GE in ICC boxes with ICC labels. 4 available. $15.00 each.

6LX6 - similar fo 6LF6 (cross-referenced to it). Same as above- tube is NOS GE in ICC box with ICC label. ONE available. $30.00

If interested, please contact by email. Shipping is usually by USPS Priority Mail, but FedEx ground is also available. If shipping desired, please include your address, for the purpose of calculating shipping cost.

Also might be interested in trades, for a working shortwave/PSB/LW/MW/FM radio/receiver. Anything of the sort of a Ross RE8000 or that ilk, or better, will be considered...

Regards,
Gordon.

1330. Best ARRL handbook editions?

Hello all,
I have discovered how much fun tubes can be, and am in the process of planning one or more transmitters to go along with my 2-tube regenerative receiver. Now, I'm only 23 years old, so I'm in the process of researching hollow state technology. Could you please put together a short list of the "best" ARRL handbook editions? I have 99 and 05- I'm just looking for a few years to watch for on amazon, etc. Of course, recommendations for other books would be appreciated, too, but I'm on a tight budget...

Thank you very much in advance for your advice.

Ross, NS7F

IMHO what you should do is go to a library and find where the major
"houscleaning" was done and then get the previous edition. For example,
I have a 1995 (blue) edition, and it was much better IMHO than the
1996 (red) which I also have.

In any case, collecting a set of them may not be of much use to you.

Tubes have not changed much in a long time, so getting an early edittion
with lots of tube data and then copies of articles you want may be
a much better use of money and space.

73.

Geoff.

I have the 1964 and 1966 versions and there is VERY LITTLE difference between them.

They have designs for 4 simple transmitters with power that range from 10 watts to 100 watts. Also, they have a fairly good 'teaching' on transmitter and power amplifier design techniques [for tubes of course!].

I agree with the post that responded that they are quite similar within a basic technology. So, if vacuum tube simple transmitters are your passion, [desire, wants, likes, etc.] any of the ARRL handbooks from the late 50s to mid 60s should meet your needs.

Forgo the handbooks and look for QST magazines from the
40s thru the early 60s. Many larger libraries have the bound
editions... At worst, look for some used QST on CD editions
from that era.

Ross,

If you're interested in hollow-state technology, there are
lots of *free* resources on the 'net:

First up is Pete Millett's excellent book site:

http://www.pmillett.com/tecnical_books_online.htm

There are many excellent reference books online there,
free for the download, including ARRL Handbooks from
1936 and 1941 (IIRC). The files are often large but if
you have DSL or better they only take a few minutes.
With dialup they become a late-night hit-the-download-button-and-go-to-
bed thing.

He also has tube data online:

http://www.pmillett.com/hb-3_tube_manual.htm

The Glowbugs website has lots of downloadable info:

http://www.mines.uidaho.edu/~glowbugs/index.html

including some good manuals and articles on WW2 military surplus:

http://www.mines.uidaho.edu/~glowbugs/Military__and__Surplus.html

http://www.mines.uidaho.edu/~glowbugs/PDF%20files/

On the Glowbugs website are instructions on how to
sign up for the Glowbugs email reflector. Lots of good
folks trading info on their projects.

"Bunker of Doom" site with lots of stuff:

http://www.bunkerofdoom.com/

Transformer catalogs and other data:

http://www.bunkerofdoom.com/xfm/index.html

Another good site:

http://www.antiqueradioarchives.com/archives_index.htm

If you want the actual books, I would recommend
ARRL Handbooks from about 1954 to 1965, and RSGB
Handbooks. IMHO the RSGB Handbooks go into more
depth on technical subjects, and have better construction
articles, but the use of European tubes and other
unobtanium parts makes them difficult to duplicate.

Also be on the lookout for the ARRL publication "Understanding Amateur
Radio" (1st edition) ,
which has some good lowcost projects and well
written explanations.

Sign up for the Glowbugs reflector now!

If you are interested in tube gear then the ARRL handbooks from the early 1950s would be good. By the 1970s, the trend was toward solid-state gear. Of course, the 1940s handbooks are good too, but I like the ones from the 1950s best.

My 'old' ARRL Handbooks are the 1936, 1947 and 1963 editions. I am
still looking for an inexpensive mid-fifties edition. Having one
edition from each decade seems to make the most sense as they do not
radically change from year to year.

My Ranger is blowing the 5 amp primary fuse every once in a while when I turn it on. I have checked for any kind of intermittent short but unable to find anything. I am now suspecting inrush current. My Ranger has all the power supply mods. Solid state HV and LV power supplies with 330mfd LV cap and 165mfd HV cap. At first did not suspect inrush current due to having choke input filters but I suppose with the solid state rectifiers and the large caps it maybe happening. Does anyone have any suggestions to limit this inrush current in the Ranger. Also, does anyone know what the Ranger's nominal current consumption is from the 117 VAC source under full load? Any info is appreciated. 73, Randy

You might try a slow blow fuse. You could be right
about the inrush current with the solid state recifiers and
much larger than original caps.

I am 63, and retired, and am also having a ball building my own tube gear.

Generally, solid state began to take over all the low level circuitry in the ARRL handbooks in the 1960s and particularly afterwards. There was a blend (between tube and solid state) at some interval but I don't look at the later handbooks at all any more. My handbooks are from early 1960s and go back.

The "Radio Handbook" by Bill Orr, also has editions going back, annually or almost annually, for a long time and has a different flavor but also good, and alternative presentations including very nice schematics and photos. The Radio Society of Great Britain (I think) also sponsored ham radio handbooks but I think may also be geared to European tube types which are different (at least to some degree) than US "valves" (as they call them), but you might try to do some research on that.

You might want to think about the tube evolutions: the very early tubes are harder to find and more expensive and particularly the tube sockets.

Around the 1940s we had mostly octal base (key plus 8 pins) and they are easy to find from tube supliers, but many were metal (not good if you like to see those filaments light up). If you like battery filament types (1.4 v for single C cell, 2.0 v for lead-acid cells, and 2.8 v, for two C cells in series) you have a small variety of nice 7 pin tubes (eg. 1T4, 1U4, etc), and a few 8 pin octal tubes (eg. 1A7, 1H4, etc). Prior tubes had poorer specs and the sockets are hard to find. The so-called Loctal

tubes (very thin pins and special 'click in' keys)..you just about can't find sockets for and they would be the hardest to build homemade sockets for, and, they themselves are not easy to find, either (I think they were mostly for car radios). Most of these tubes will run plate voltages on a handful of 9 volt batteries you can get at Dollar Tree for two for a buck, and you hook them in series with each other since the connectors are all male-female and otherwise don't need much to hold them together if you just lay them on the table and hook aligator clips to the terminal negative and terminal positive. A lot of the earlier tubes have difficult to find sockets (but Radio-Daze, in New York, has a lot of sockets).

Public libraries can be a resource but be aware that most smaller ones "discard" their older holdings and replace them with newer versions. Your best bet is to ask at the reference desk to find out how you can find which library has the older editions. The _central_ or _main_ branch (in your state) may be the only one that keeps older editions but you should be able to arrange an inter-library loan where you can borrow the book for, say, two weeks, and then if you like it, look for a copy on Amazon.com or www.addall.com or www.bookfinder.com or www.abe.com or www.alibris.com where you will find used copies at generally very reasonable prices. To find booksales where used books are very cheap, go to: www.booksalefinder.com

Good luck.

You probably would find a varistor in the primary of the transformer to be
of help. It also improves the life of the power on-off switch at the same
time.
We used one in the primary of the Signal One transceivers after having
measured an one cycle inrush current in excess of 50 Amperes! (Hypersil core
transformer) You can purchase them that exhibit a hundred Ohms or so when
cold that drop to 4-6 Ohms hot and essentially remove themselves from the
circuit after the first few moments of operation. They don't help at all if
you turn the radio off after a period of use and immediately power it back
up whilst the varistor is still hot, but it takes the edge off the inrush
curent in "normal" operation. About the size of 3-4 nickels stacked together
with a radial lead off each face.

Thanks for the info Harold. I think that is the way I want to go is
with the ICL Thermistor or Varistor. The only thing I need is to find
out which one to use. Looking at them in the catalog, it seems the
deciding factor will be the maximum sustained current from the Ranger.
If I need a 4 amp Thermistor then it may only provide about 10 ohms
resistance depending on the current. Would 10 ohms do enough inrush
suppression? It seems the higher current models have the lowest
resistance. I will need to do a little more research into this and try
and pick the right one. Possibly two of them in series will do the
job? I have read where someone used a Thermistor p/n CL-90 on a
Hammerlund receiver with good results. This CL-90 has a 120 ohm
resistance and a 2 amp current rating. I would be concerned that this
2 amp rating would not be enough for the Ranger. Would 2 of these

CL-90's in parallel give me 60 ohms @ 4 amps??
If someone has not already tested for this. I want to check the AC current on my Ranger at maximum AM, 100% modulation transmit. This should give me a good idea about which ICL Thermistor to look for.
Thanks for everyones input, it is very helpful.
73, Randy, WB5KCM

Very possible that the meter switch is intermittently arcing, causing the fuse
to blow. I ended up having to replace my meter switch, which cured the problem.

A better way is to take a relay and connect its coil, through a selected resistor, to one of the low voltage supplies. The relay's NO contacts should be put in series with the power line, and should have a 5 or 10 ohm power resistor across them.

When the power is switched on, the 5 or 10 ohm resistor will be in series with the power line, and the power supply will start to charge the filter capacitors. When the filter capacitor's DC gets to a high enough value, the relay will close, and apply full mains power to the primary.

This circuit has two inherent flaws: 1) if the filters get leaky, they might never charge up enough to close the relay, and the power resistor will overheat, and 2) the relay will draw current from your power supply.

WHEN is the fuse blowing?

If it's blowing at times other than initial turn-on, it's not an inrush
current issue.

I just want to say that if you want to build your own tube gear, you
should look seriously at compactrons. Designed for consumer electronics
use, they have some excellent specifications and a lot of elements in
a package. And they are absolutely dirt cheap because there is no demand
for them on the surplus market at all.

Some of these things are absolutely wonderful performers and available
free for the asking. 12 pins good!

Hey Scott, once I turn on the Ranger it does not blow the fuse. Its
just every once in a while as soon as I move the switch it never turns
on and when I check the 5 amp fuse it will be blown. I am going to
install 1 or 2 Thermistors and give that a try and see how it goes.
Thanks for the input. 73, Randy

Chuck, interesting idea using the relay. I will keep your message. I
am going to try the Thermistor and see if that will do the trick. The
concern I have with the Thermistor is if it will handle the current
that the Ranger draws and if it may cause poor regulation in the AC
side. I am going today and pickup a couple of the CL-90 Thermistors
and give them a try. I will report back possibly SUnday with the
results. If the Thermistor doesnt work, I may build up something like
your relay idea into an external metal box and use this. 73, Randy

If you are going to put the relay in an external box, use a 555 timer
to control the relay's coil.

I believe you could have a coil made by Cambion Thermionic Corp. They still excessed, but current part numbers are not the same. They have droped The Thermonic from their name. The "03" is a indicator of inductance value, but depends on coils size and exact type. Just a hint and hope it helps. 73 Tom

Inrush current could be an issue. Adding a PTO thermistor is certainly
not a bad idea and probably should be done on every piece of equipment
out there with an expensive power transformer. Extends tube filament
life also.

Well, I'm already committed to 7 & 9 pin miniatures, and 8 pin octals,
have plenty of sockets, and more than enough tubes for my lifetime.

Once, long ago, I had a filament battery portable AM radio. About half the
size of a cigar box. Four tubes, one D cell, one 90 v B battery, and lift
up the cover, and it goes on in about 1/2 second, and sounded good. If I
have time, I'd like to build that (if I can't find a replica, or a similar
set [I think the old Zenith trans-oceanic had battery filament tubes, too,
might be interested in one of those instead]). Just for nostalgia.

I have just re-capped the power supply capacitors in a DX-40 with 40uf 450 VDC Aluminum Electrolytics from NTE Electronics in New Jersey.

I have noticeable hum on the carrier. Measuring the ripple voltage with a 10 Megohm ac coupled meter shows 2.3+ volts [average/rms ... non-sinusoidal] on the 600 vdc line and 1.2 volts [average/rms ... non-sinusoidal] on the 300 vdc line.

It appears the RS of the capacitors is way too high.

What manufacturer or brand are others using with success? Does MOUSER carry suitable replacements? If so, what brand/style?

Other sources?

TIA

Your ripple values look ok to me. They calculate out to
be under 1%. (0.4% rms)

You probably have a problem elsewhere, such as a heater-cathode
leak, or short.

How do you know you have hum? Are you listening
on a local receiver? If so it could be a form of
"tuneable hum" caused by the AC in the house wiring
modulating the received signal. If you have a good
scope, try looking at the waveform directly; any
hum will show as modulation riding on carrier.

The amounts of ripple you're seeing are very minimal,
as others noted...

Pete

No ripple on the audio power buss [400+ vdc. < 0.001 vac] This bus has a RC filter of 20K and 20 uf. It is clean.

It is in both the AM & CW mode. So, it has to be the rf string where the +600 is common to the two 6CL6s [series connected] and the 6146. I'm beginning to suspect heater/cathode coupling/short in one or more of those tubes.

I gave my scope away about 5 years ago ... :-(

I have an EE degree and 40+ years of design/management experience, so a little trouble shooting is not a problem for me. But, I have no capability to measure capacitor ESR.

Well, I'll keep playing.

Thanks for suggestions.

Randy-

Suppose both the RF section and the modulator used 100 watts of power each, and filaments used another 50. That would be roughly 2 Amps at 120 VAC. You should use a fuse about twice normal current, so 5 Amps would be reasonable.

If that blows, it very well could be due to inrush current related to the solid state rectifier conversion. Vacuum tube rectifiers would have required a warm up, which would bring their output voltage up gradually. Using something like a 47 Ohm 10 Watt resistor in series with the input of each set of rectifiers, might be all it takes to tame it.

What is the voltage across each filter capacitor while in standby or key-up? I would worry that voltage might exceed the capacitor ratings after conversion to solid state rectifiers, especially under no-load conditions.

1374. A question on tube rigs in general, Kenwood in particular

Newsgroup: rec.radio.amateur.boatanchors
Date: 2007-04-15 03:49:07 UTC
From: billcalley <billcalley@yahoo.com>
Message-ID: <1176608947.203813.293270@y5g2000hsa.googlegroups.com>
Source record: 8219
Cross-posted to: rec.radio.amateur.equipment,rec.radio.amateur.boatanchors

Hi All,

I have a Kenwood TS-530S, but I'm sure this question applies to most other tube rigs: Why is there even a TUNE setting on the MODE switch? I know that with this switch engaged the "input power to the final section is reduced to prevent tube damage during tune-up", but why not just adjust CAR (CAR LEVEL CONTROL) downward for this step, since CAR also controls "carrier level during CW operation". Is it simply a matter of convenience, or do these controls actually do somewhat different things?

And while I'm on that subject of carrier level, I need to lower my 100 watts to about 10 watts. Is the best way to do this by simply lowering the CAR control? Does this technique give all the advantages, such as more protection to the finals (with a high VSWR) and generally longer tube life?

Another quick question for anyone who is familiar with the Kenwood TS-530S with the 500Hz CW filter installed, but I noticed that unless I move IF-SHIFT counter-clockwise, the audio output is not centered on 800 Hz, but more like 1200 Hz or so. Is this normal for Kenwoods?

Thanks for any help!

-Bill

Who makes them? NTE does not make capacitors, they rebadge them.

I have been using the Panasonics from Digi-Key for years with no problem.
Always go for 105'F types, even for lower temperature applications. The
BCC ones are fine also.

I am surprised you would have any issue with the NTE ones, though... even
the cheapest caps today have better ESR than the caps of the sixties. I
might look elsewhere first, like a bad rectifier.

Bill,
Do you have the correct CW filter installed?
Kenwood offered the C filter and the C-1 filter.
The difference is the center frequency.

I remember on my 930, there was a pitch control.
Do you have one? If so, how is it set?

Hi Ed,

Thanks for the response! Yes, I have the proper YK-88C filter installed. And it is not the actual CW pitch/tone that's off, but the filtered passband output into the rig's speakers. The audio output, unless the IF-SHIFT control is moved counter-clockwise to center it, has the CW signal at 800Hz, as it should be, but the 500Hz passband itself is not centered on it and extends too high from about 800 Hz to 1300 Hz...

Best Regards,

-Bill

Bill-

I haven't worked on the TS-530. In other similar models there are typically three crystals associated with the product detector, one for CW, one for USB and one for LSB. If the crystal is off frequency, it will cause a signal to be offset from its correct place in the IF filter passband.

For the TS-520, these crystals appear to be on the carrier unit along the left side of the radio on the bottom. Each crystal has a parallel trimmer capacitor. As you adjust the frequency of the detector's CW crystal, the background noise will sound different as you tune across the filter's passband.

You need a counter and a diagram to set the crystal frequencies correctly. The TS-520 service manual I downloaded does not seem to have directions to do it. I would connect the counter to the output of the carrier unit, and adjust each crystal to its correct frequency, selected with the front panel CW/USB/LSB switch. The IF-Shift control should be centered when making these adjustments.

If you can't read the frequency marked on the crystal, it should appear in the parts list.

hi bill,

join other ts-5xx/8xx hybrid fans here

http://groups.yahoo.com/group/TS-520_820_530_830/

When in tune the power level is reduced to under 2 watts.

if you want to lower your power out the car control will do
this only for CW mode. If you want to use reduced power for SSB,
in the files section in the above yahoo group there is a small
external circuit that will use ALC to lower the power out.

The FT-102 that I listed before has sold. I do have another one.
It was to be my "keeper", but I have decided to sell
it also. It has been Malcomized and has one optional CW filter,
XF455C.
This one is as close to finding a brand new one as your likely to get.
It looks and operates like new. I don't think that there is a mark on
it.
It even has the original final and driver tubes and has full output.
It comes with the original manual and I think that the box is in the
attic.
I purchased it a few years ago from the original owner who had it
Malcomized in 1996 and
shortly afterwards moved into an area where he could not have
antennas. So he put it in
the box and stored it. I will sell it for $775 plus shipping from
79602.
Thanks,
Charlie Hugg, K5MBX

Hi Fred,

Thanks for the tip! So that I don't FUBAR this up, please tell me if
I have this right (changed from your original description to take
advantage of my very limited equipment):

1. Set the MODE to CW and the IF-SHIFT to center detent position of
the TS-530S.

2. Find the single trimmer capacitor located near the 500Hz CW filter (the trimmer capacitor will be able to shift the 500Hz CW filter center frequency by some small amount).
3. View the TS-530S's audio speaker output noise on my audio spectrum analyzer.
4. Adjust the TS-530S's trimmer capacitor until the audio (mainly noise) output is -centered- on 800 Hz, according to the audio spectrum analyzer's screen.

Would the above technique work?

Thanks!

-Bill

You can't shift the CW filter, so you must shift the xtal oscillator
that provides the BFO injection signal for the CW mode.

That is correct, you must adjust the xtal BFO trimmer so that the IF noise
shows up centered on the desired CW note frequency.

Hey Fred,
The new electrolytics that I put in are much larger than the original. The low voltage power supply now has 330mfd @ 450 volts and the high voltage now has 165mfd @ 900 volt rating. With the solid state rectifiers, I am getting low load, unkeyed voltage, LV PS 305 VDC (regulated with 2 OD3 tubes). The HV PS is now about 625 VDC. Last Friday, I picked up several inrush current limiting thermistors from Allied Electronics. These have a 2 amp rating. I put one in the Ranger in series with the hot AC power lead, down stream from the fuse. This made a huge difference in the inrush current. This thermistor has a high resistance cold and as soon as you apply the power it starts heating up and the resistance drops to a very low level. It still has some resistance and gets pretty warm, about the same as a 5 watt power resistor. With this added resistance in the AC line, I notice that the power supply voltages have dropped somewhat. The LV supply is still

about 300 volts due to the OD3 regulators. The HV side is down to about 580 volts under full load. This should make everything run even cooler and last longer. Pretty happy with this thermistor so far. My only concern is how long will it hold up with the current hitting close to its max rating of 2 amps at times. Anyway, I will watch it and see what happens. I also put one in my Hammarlund HQ-170 and it seems to be doing very well there. When you turn on the power it slowly comes on. That will be very nice on the tube filamants and everything. Thanks for your input. 73, Randy, WB5KCM

1391. Heath RX-1 Dial pointer

Bill-

You may be able to accomplish your goal without a counter, but the trimmer you need to adjust is one of a group of three next to three crystals on the carrier unit. It is probably not on the filter board unless the two boards are combined in the TS-530.

I don't know for sure if the TS-520 manual is applicable. Although it shows the crystals and trimmers in a photo and on the circuit diagram, I couldn't find a procedure for their adjustment. It would help if you could find a copy of the TS-530 service manual.

The 520 and 530 are about as close as an elephant and a donkey.... About the only thing they have in common is tubes finals and the brand.

I've got a few 6AR11's and 6AF11's that I've been meaning to use for
something. The 6AR11 puts two if stages in on bottle. I also have
quite a few 85khz command set IF cans, so that would be nice. The 6AF11
makes a nice dual af stage, plus the extra triode can be used as an agc
amplifier, smeter amp, or bfo tube. I was thinking of making an all
compactron clone of the Drake 2B at one time, using a last if of 85khz
instead of 50khz to make use of the command set coils.
It would use one 6AR11 as the rf / first mixer, and at the IF stage.

A 6D10 could be the vfo, HFO and hfo buffer. The last mixer would have been a 6BE6 cause I couldn't think of a compactron for that stage.

Another idea is the one tube regen from 'pop tronics using the 6AF11.

I have for sale several accessories to the FT-102 Station:
1. Yaesu FV-102DM digital VFO. Makes the FT-102 rock stable and it has
memories. This one is in very good condition.
It works great and looks good. It does have some small scratches on the
case and around the trim, but the Front Panel is near
perfect. No manual. Price is $375;
2. Yaesu FC-102 Antenna Tuner. This tuner covers 1.8 thru 29 Mhz including
the WARC Bands. It works good. Cosmetically,
it has some small scratches on the cabinet and on the trim and front
panel. Still, it is very presentable. There is no DC cable or
remote antenna switch unit or manual included. Price is $325;
3. Ysesu MD-1C8 Desk Mic. This mic is in very nice shape. It works well and
has a new mic clip. It put a Heil Mic chip/holder on it.
Price is $75.
All prices include shipping within CONUS. Thanks, Charlie Hugg, K5MBX

1406. Drake Wattmeters FS

What is so unusual about ***that*** speaker
that a link for it should be spammed to
numerous newsgroups? It seems
that the boatanchor group was arguably the
appropriate place for it. There are several WWII
Scott military receivers at auction right now.
Let's post links to them. What are they being
snubbed and the speaker featured??
Heck, there's an Allied SX-190 SW receiver
there too, it was perhaps their best effort..
Let's post a few links for that as well.

Do you thing every "golly gee whiz" item should
be linked here? 90 percent of the stuff sells, so it must
of interest to someone, so using that logic every eBay
auction should have a teaser here?

Where do you draw the line on this nonsense?

And to answer your other question, the posters
are usually added to my blocked poster filter.
The future teasers from Cmdr. Cooty will be ignore.

Pete

Maybe I'll do an ebay search and post those links as well. I was
searching on eh scott and happen to see this speaker. If you aren't
into boatanchors I suggest you just ignore it and don't get your
shorts in such a knot.

You need to learn the definition of spam. Posting the link once to two newsgroups where the participants might be interested (there are those who read this group that are into boat anchors in case you have never noticed) isn't spamming.

So what is the difference between the posting of this link than all of the other "FA" and "FA not mine links"? Actually it really doesn't matter what you think anyway , you don't own the group.

1412. Ar77/GR10 modifications made in mid 1960's.

Hi all!
I've recently aquired a receiver of this type which has been modified back in 1966. Basically the original octal tubes have been replaced with B9A and B7G types like the ECF82 and EF183.
It was modified (officially I think) in New Zealand, but the mods may perhaps originally come from either Australia or further overseas.
Has anyone come across a schedule for this modification.
I've already got the RX working but I would like to clean up some of the now redundant wiring and this will be much easier with such data.
BTW it has the original S meter.
Any help greatly appreciated.

I recently won a HOMEBREW 23 channel CB receiver. Yes I know it's not a real boatanchor but given that it has 11 tubes plus several diodes , I thought I'd ask about it here. It looks very well made.

I was hoping that some one would recognize it by tube line up. I just looked at it and haven't started drawing the schematic yet. It has the following tubes, 6EH7 (the RF amp) , 12AT7, 12AU7, 6BN8, 6HR6, 6BA6, 6BE6, 6GX6, 12AX7, 6AQ5, and an OA2. It has 6 RF and IF transformers.

The antenna is connected directly to a transformer with the RF amp feed by a cap off the secondary. The first oscillator(?) Uses a 29305 Kc crystal. It has a "S meter" and what I suspect is a meter adj. pot on the back. There is a octal socket on the back labeled transmitter that has two lines jumped as well as a voltage divider with a large electrolytic to ground in the middle of the divider.

The tuning cap is three section with one section switched by a control on the front panel. The tuning cap is driven by a very nicely home made dial cord mechanism with a heavy flywheel. So far I have figured out the RF and audio gain controls. The other two front panels pots function are a question as well as the functions of four multi section toggle switches. With the filter caps being bad. I have not powered it up for more than two minutes.

Does anyone remember a home brew rig with these features HAM or CB? I would like to find a schematic if possible. I looked at the HBR site and it doesn't seem to match anything there. But given the limited 23 channel coverage plus channels A-D it looks like it's from the late 1960's or real early 1970's .

Thanks

Jim

Jim,

I'm very surprised to hear that someone would homebrew a CB rig: I'd guess it's a commercial unit without the front plate unless the workmanship is definitely "homebrew".

The mixer crystal is a puzzle: it implies an IF in the ~3.3MHz range, which I've never seen before. OTOH, if it was made for 10 Meter ham use, a 29.305 MHz crystal and a 455 KHz IF would work out to either 29.760 or 28.850 MHz, and only the lower frequency is in the 10 meter band. It might have been a custom-made unit for CAP or other use on 29.76, but I don't have any experience with those.

I'm going to guess that you have a CB set that was modified for either 10 meter ham use or for some quasi-government use on 29.76.

HTH.

William

While we are on the subject of DX-40s, I have one with a problem that's driving me nuts. In AM mode, just sitting at idle, the plate current pulses up about every second or so. The scope shows a pulse on the plate of the second 12AX7 audio stage. It's acting like some sort of relaxation oscillator. I've rebuilt the audio section to no avail. Anyone have an idea what the heck is going on?

Typically, this sort of thing is a form of motorboating. There are
a couple of ways it comes about. One is through power supply sagging
as current in some stage starts increasing. The supply sags until
a certain point is reached where the current in the affected stage
decreases, and the cycle continues. It is very low frequency because
the power supply filters are the resonant element.

Another way it can happen is through grid leakage. Many tube stages
of the low power sort have a resistor from the grid to ground that
is supposed to keep the grid at a reasonable negative bias value. If
that resistor is open circuit, or if the tube develops excessive
gas, the grid, the leakage, and the coupling capacitor of the
previous stage can get a relaxation oscillation thing going. A leaky
coupling capacitor, such as C27, or C25 can do the same thing. Look at
pin 7 of V4. Try paralleling a 1M resistor on that stage and see if
it changes the rate of the motorboating. If it doesn't, try the grids
on the 12AX7... and, of course, replace C27 and C25...

IN the sixties (and early seventies), it was common for the hobby electronic magazines to treat CB as a hobby. This was especially so for "Electronics Illustrated" that had quite a few construction articles, going from simple to quite sophisticated. So you could build a panadaptor to check out the adjacent channels, and a receiver to monitor channel 9 (when it became a designated emergency channel) and even a grid dip oscillator for "Class E CB" up at 220MHz, even though that service never came to pass.

THere is nothing unique about the description. I can't recall seeing much in just tuneable CB receivers in the hobby magazines from that time, but it sounds like a relatively generic receiver (and he did say receiver, not transceiver).

If it is a CB receiver, there's nothing to guarantee that it was built from a description in a magazine article, or that it's a direct copy of something. Someone could have made it up, or copied something else with mods for CB. Afterall, no matter what the unit is, someone has to create a unit before they can write it up in a magazine, so something can exist without a magazine writeup.

And given that he says it's a receiver, if it was a commercial unit the pickings are slim. I can think of only one manufacturer that made a standalone CB receiver.

In the early sixties I ordered one of those cb kits from an
electronics magazine. It consisted of a crudely punched chassis, a bag
of parts and a schematic. I never did get it to work.

I thought building a kit CB transceiver was illegal due to the type
acceptance issue?

Certainly Heathkit got around the issue with their full blown CB set(s)
by having the transmitter arrive as a preassembled module.

But I thought there was a CB "Benton Harbor Lunchbox" for a while,
and I can't imagine they would have a module for such a low end
unit.

So perhaps the type acceptance came a bit later? I can't remember (not
that I was aware of such things at the time, but I have read lots
of back issues of magazines).

In the very early days, there was equipment being made out of people's
garages. So either the rules were more lax then, or from the outside
there were companies selling things that weren't legal.

It may be now, I don't know. At one time Heathkit put out a kit called a
CB-1. This was a simple CB and not at all like the one being talked about.
There may have been others, but this is one I know of for sure.

There was a period, long, long ago, when CB was young, and I was not
yet but a leering glance, that building CB gear was okay.

It stopped being okay before the explosion of the mid-70s.

--
Lawrence Statton - lawrenabae@abaluon.abaom s/aba/c/g
Computer software consists of only two components: ones and
zeros, in roughly equal proportions. All that is required is to
place them into the correct order.

There were a number of kits as I remember. Heath had several, as did
Allied (Knight Kits). These could be at least as sophisticated as the
mid-range factory units of the day.

Many years ago I worked in a Motorola service shop. One day a gentleman came in with a Heath CB kit he had built and wanted to know if we could fix it for him. I explained our minimum charge and hourly rate and he agreed to an hours work to see if we could get it running. Several days later we had a lull in the important work so I pulled the CB off the shelf and opened it up. I was astonished! All component leads were full length! He hadn't trimmed a one! It must have taken him hours of carefully bending leads so he could get it into the case without shorting anything. Needless to say, virtually every stage in the RX was oscillating. I did a bunch of cutting and resoldering and finally got it working. I wish I had a picture of my face when I pulled it out of the case!

The tube lineup is from the later generation of miniature tubes - which means mid 60's. It looks like the first conversion oscillator is crystal controlled and the receiver uses a tunable if stage - similar to Drake. That means it would be easy to change thr crystal controlled first conversion stage and cover any other range. Might be a good 10 meter receiver - or perhaps the 12 meter band. There could be some value to a cb collector, since few home brew receivers were made.

One of the pots might be noise limiting adjustment, or one could be for a Q-multiplier.

If you check the screen voltage of the 6146 I expect you will see it pulsing from 70 +/-10 volts to over 100 volts, possibly to 160 volts. Seventy volts is normal screen bias in the AM mode. With modulation it follows voice peaks to ~150 volts.

The time constant of the 6DE7 to 6146 RC circuit is about 0.025 seconds. So, I would exclude the RC between the 6DE7 and the 6146 screen.

I would check pin 6 of the 6DE7. It should be stable in the AM mode. The input circuit to the 6DE7 has a 0.1 second RC time constant. If the input is stable [pin 7] and the output is pulsing the replace the 6DE7. If the input [pin 7] is pulsing then check the RC from the 12AX7.

/s/ DD

PS: let us know what you find out.

> --scott

I assumed the caps had been replaced. But, replacing them is a GREAT idea for several reasons if you have not yet done so.

There are four electrolytics. The two 40 uF in the high voltage supply. Mine warmed up immediately on power application and started to leak. They were replaced with aluminum electrolytics for about $9.

There is a 20 uF 450 vdc cap on the audio, 12AX7, plate line with a one second time constant. Check that capacitor. The time constant matches your symptons. That makes it a good place to start.

The final electrolytic is a 2 uF connected between the 6DE7 output and the 6146 screen. I replaced mine on principle ... I had no problems in this part of the circuit.

Didn't one issue of like an RCA Tube Manual - have a schematic in it for a
cb receiver or "transceiver"? I know I've seen them out there.

ISTR:

- Heath equipment was acceptable contingent on being assembled
according to the instructions. There was a notice in some of the manuals
about that - ISTR some devices where one part was a Part 15 label which
the builder was to sign & date & stick to the completed kit certifying
they'd followed the instructions.

- It was legal to homebrew CB gear in the early days of the service, but
that rule was changed - well before the 1960s. (I'm not sure it was
ever legal to homebrew 27MHz CB gear, it may have only been legal for
the old 470MHz stuff)

It may not have been in the US, but before regulation and since
deregulation, one can build up to 5 CB's and call them prototypes in .ca
land, as long as they meet Industry Canada (then the Department of
Communications) specifications.

Maybe it's a Canuck rig?

Cheers,

Back in the '60's - I was building AM broadcast transmitters, not CBs - however - here in ought 7 - I have a 1962 Allied catalog in which the back section is a KnightKit catalog. On page 408 there is a C-11 Citizens Band Transceiver Kit ($39.95). It transmits on any 1 of 22 CB channels depending on crystal installed, and it manually tunes all 22 CB channels. It does not list the tubes, but does note it's a superhet.

On the next page is a model C-27 Deluxe Transceiver Kit - for reception it too manually tunes all 22 channels - plus has provisions for two crystal controlled channels. The same switch also selects one of two transmit frequencies. This is a dual conversion receiver, and while it again does not list the tube compliment - it does say "7 dual-purpose tubes, 2 single-purpose tubes, VR and rectifier". Since it mentions regulated supplies for the oscillators, pretty sure that's the "VR". $79.95 plus 2nd crystals - $1.95 each (transmit or receive, specify channel).

best regards...

Thanks for all the replies.

The chassis is very professionally done. The wiring is not so well done. The filter cap wiring on the transmitter socket divider is a joke. Thus the idea of a kit seems reasonable. There is only one crystal socket. So the Knight Kit seems to be out. Family issues are keeping me from more work on the rig right now, So I'll have to just wait see what else is posted here, for a while before trying to draw a schematic

I really am impressed by those that want to help, plus I've learned some things.

Thankjs again.

Jim

What about that old Hammerlund CB...was it called the HQ-105? or
something like that. Possibly someone put on a different front panel
and it now looks to be homebrew?? Just a thought.

Medical diathermy sources come in two kinds: electrocautery systems used for surgery, and deep tissue heating. The deep tissue heating systems were the big offenders, since they were often left operating for long periods of time.

The deep tissue heating systems have most been replaced with ultrasound, although some RF-based deep tissue equipment still exists. Electrocautery is still around.

Aside from the reduction in use of deep-tissue heating systems, the RF characteristics have been improved a lot. Some early systems were just relaxation oscillators, running more or less in an ISM band with lots of impressed 60 Hz trash and lots of harmonics. That stuff has all been cleaned up and modern medical devices are now clean enough that you could add a key to them and use them on 10M.

You ought to get one. Tubes can sometimes have weird "heat-up-short"
cycles and if everything else is _new_, look at what you have yet to
not yet replaced.

You might try "bridging" in -- with aligator clips--external electrolytics
at those locations in the circuit where an on-board electrolytic might be
going through some kind of "charge-up-discharge" cycle to cause the spike.
One of the guys who answered this had a good idea about that.

Did your rebuild the audio section with all new capacitors? Sometimes even
new components can include a run of defects in a given lot.

What else is the second plate of the 12ax7 connected to?

Are the working voltages of the new capacitors you put in all higher than
any voltage you expect on those circuits?

Back to DEERFIELD!!!!

W1RC, K1TWF and N1IWV invite ALL radio enthusiasts to attend the Spring 2007 NEAR-Fest at Deerfield on Friday May 4th and Saturday May 5th 2007! The Deerfield (NH) Fairgrounds was the site of the legendary "Hosstraders Tailgate Swapfest" for fifteen years until the event was moved in 1993. "Hosstraders" is just a memory now but NEAR-Fest is continuing the "Grand Tradition" and returning to the magnificent Deerfield Fairgrounds.

Full details may be found at: www.near-fest.com

FIRST,

Mike Bryce, WB8VGE [The Heathkit Shop]
http://www.theheathkitshop.com/
and Jeff Weinberg, W8CQ [Harbach Electronics]
http://www.harbachelectronics.com/

have been offering replacement capacitors and boards for Heathkit products.
An ideal solution for the inexperienced newcomer -- who does not wish to
guess about replacements or repair parts.

Here are the "Major" distributors for new electronic components.

DigiKey
http://www.digikey.com

Mouser
http://www.mouser.com/

Allied
http://www.alliedelec.com

Newark
http://www.newark.com/

MCM Electronics (a favorite for radio-TV shops)
http://www.mcmelectronics.com/

all have ample selections of Vishay/Sprague; CDE/Mallory and Panasonic models.

Start with 2 of the major mfg. for specifications and selection.

CDE - base in South Carolina (USA)
http://www.cde.com/

CDE Selection Guide
http://www.cde.com/catalogs/aesg.pdf

CDE Application Guide
http://www.cde.com/catalogs/AEappGUIDE.pdf

and Panasonic (Japanese) - available from DigiKey
**Panasonic has been slowly discontinuing some of their screw terminal models -- favoring the "snap in models"
http://www.panasonic.com/industrial/components/capacitive/cap_lcanelec.htm

Panasonic Computer Grade
http://dkc3.digikey.com/PDF/T071/1283.pdf

Panasonic Snap-In

I have also got a Gonset 112 to 132 mhz rcvr. Seems to work. Im
curious if it is rare or sought after or anything.
Im not in a rush to sell it..just testing the waters and curious. As
well, about the miller coils and transformers.
They are mostly metal case about 2 inches h and about 3/4 of an inch
each side. I think they must have
been used in homebrew projects for ham operators (probably mostly
receiver projects) ie 455 khz if and other
frequencies I have. Were they ever used in commercial radios or just
mainly homebrew.
73 Earl VE3AB PS..I will be at the Smiths Falls Ontario Flea Market
May 12 this year. Im just going through
some stuff to figure out what to keep and what to part with. I also
have a web site with a swap page. It is
my name Earl Andrews with a dot com extension all lower case letters.
Lots of good ham projects including my
homebrew variation of the R7 Vertical.

It's possible that it is locked in place at a set capacitance. I think
that was usually done with a nut on the shaft.

Otherwise, I'd use some penetrating oil on it...

Get the Antique Electronics Supply catalogue, which has a complete price list of common tubes. Their prices are generally reasonable and about market value, so their catalogue is a handy reference to carry when you go to the hamfest. Don't pay more than that.

A few years back I sent a big box of tubes to a place maybe in
Colorado that served as a tube bank for people who needed some. The
tubes were free for the asking. Anyone remember this or know if it is
still around?

If you like tubes, go on e-bay and look for any ARRL handbook from the late Fifties. That was near the end of the tube era, and you may still find a few NOS tubes from those days at the surplus places.

The Gonset aircraft monitor is not rare. However, there is little demand among collectors for it. For monitoring aircraft frequencies, modern digital circuitry is much better. You can set the frequency instead of tuning and drift is a thing of the past. So, as a user, it is pretty worthless.

The only value is to sit upon a shelf in a collection of Gonset radios. Good luck. There are probably 5 collectors in the world and all 5 already have one.

Gonset made a lot of equipment for the commercial market. Years ago, Fair Radio was selling a Communicator for the aviation band. They were no longer type accepted and had the same receiver your unit had.

I would expect to see them at a swap meet for about $15. But, I would pass it up.

I do have a couple of Gonset Communicators I do need to restore one of these days.

When was this? I remember about 2000 or so being in the tower at a major metropolitan airport, and seeing doubly-redundant radio systems, plus an additional emergency VHF set, but then seeing an old Communicator under the table. Just in case.

>I would expect to see them at a swap meet for about $15. But, I would pass
>it up.

The aviation band and 2M models were pretty much the same, other than a few coils changes. Remember the 2M model was AM also.

>I do have a couple of Gonset Communicators I do need to restore one of these
>days.

I remember using the 2M one with FM modifications in the late eighties, and getting good signal reports with people absolutely amazed I was on a Gonset. During an emergency situation I checked into a repeater with a report of some lines down, and was told that I had to report it on a different frequency. When I said I didn't have a crystal for that frequency, the response was priceless.

Hi,
Does anyone have a Sky Buddy center dial? Te one that lights up?
Mine is missing and has a homemade one there that's not real nice.

Also, looking for the NC diamond for a National Company radio speaker.

Also, has anyone restored a Brunswick TRF Radio? The dial markings
are worn and was wondering if there was a decal made for that by
anyone.

Also, anyone with Victo 9-54 parts? Long shot, but had to ask.

Thanks,
Dan

Hi All,

I need some power cord to use on antique fans. I would like cloth
covered cord, cloth covered round cord would be even better. Anyone
know where I can get this in bulk? (as in under 100'),

Thanks,
Mark S.

1479. RS232 Remote Adapter for Harris RF350K / RT-1446
